1 Executive summary

Treetec was engaged by the City of Whittlesea on behalf of the Victorian Planning Authority to map and assess all trees of high, or very high Arboricultural Retention Value (ARV) within the boundaries of the proposed Shenstone Park 1069.1 PSP, and the adjoining buffer zone to the south and east.

The site assessments were undertaken between mid-October and mid-November 2016.

Shenstone Park 1069.1 PSP is bound by Donnybrook Road to the north, the Wollert suburb boundary to the south, the Urban Growth Boundary to the east, and the Sydney/Melbourne railway corridor to the west.

The northern boundary of the assessment area adjoining Donnybrook Road is zoned as Urban Growth Zone (UGZ), the south east section of the site is zoned as Rural Conservation Zone – Schedule 1 (RCZ1) and the south west section is zoned as both Farming Zone (FZ) and Special Use Zone –Schedule 4 (SUZ4).

The additional assessment area is covered by an Environmental Significance Overlay, specifically schedules 1, 4 and 5 (ESO1, ESO4 & ESO5).

All trees within the subject area were assessed, a total of 379 trees were identified as being of high or very high ARV. The dominant species being River Red Gum, (*Eucalyptus camaldulensis*).

- Fifty-one (**51**) trees were assessed as having **very high ARV**.
- Three hundred and twenty-eight (**328**) as having **high ARV**.

The trees assessed are primarily located in five larger clusters also with some smaller groups and scattered trees (see maps in section 3), The trees overlap from within the Shenstone Park 1069.1 PSP area into the buffer zone of approximately 250m to the south and east.

The trees detailed in this report include all higher ARV trees in the area and therefore if they are retained and protected then the majority of the arboricultural related amenity at the site will be preserved.

Individual trees and tree groups can be retained and protected within development areas so long as adequate protection measures are taken. These measures primarily relate to:

- allocating adequate space around retained trees, and
- ensuring trees are not damaged during the development process.

Large old trees provide significant value and amenity in urban areas, also they present additional hazards; risk can be controlled by minimising use of areas under and surrounding trees along with ongoing tree care and maintenance.

2 Introduction

2.1 Purpose

The purpose of this report is to inform the City of Whittlesea and the Victorian Planning Authority on the identification of significant areas of arboricultural value.

Treetec understands that the data collected during the field assessment will be used to inform the precinct structure planning process. Treetec has identified those trees that:

- Contribute significantly to the natural amenity of the precinct.
- Provide significant ecological value.
- Are of sufficient vitality and condition to persist long term if protected.

2.2 Scope

- 1- To identify all trees within the precinct and nominated additional assessment area that are of high or very high Arboricultural Retention Value (ARV).
- 2- Collect and document data on the subject trees including (but not limited to) the species, dimensions (trunk diameter, height, spread), estimated age category, origin, vitality of the tree (health, structure), Useful Life Expectancy (ULE), Arboricultural Retention Value (ARV), and a photograph.
- 3- Present the locations of the assessed trees visually.
- 4- Provide recommendations relating to the protection of the subject trees.

2.3 Method

2.3.1 Site inspection

An arboricultural assessment was undertaken by Treetec staff between 14th October and 15th November 2016.

The City of Whittlesea provided a list of those properties for which permission for access had been granted, as well as the associated names and contact details of landowners.

One property within the Shenstone Park 1069.1 PSP was not accessed due to refusal of access; this area has been highlighted on the site map in section 3.1.

2.3.2 Inspection method

Electronic data collection forms were used during fieldwork in conjunction with handheld GPS units.

- All observations were taken at ground level, using the Visual Tree Assessment (VTA) method (Mattheck and Breloer 1994).
- The nominated additional assessment area was approximately 250m south and east of Shenstone Park 1069.1 PSP.
- Trunk diameter was measured with a DBH measure for calculation of protection zones.
- Data and location was recorded using GPS/GIS enabled handheld devices.
- A photograph of each tree was collected.

2.3.3 Arboricultural Retention Value (ARV)

Arboricultural Retention Value is defined by the consulting Arborist as being:

A rating assigned to a tree or group of trees related to the value of retaining those trees in situ. The judgement is based on tree condition (Health, Structure & Form), Useful Life Expectancy (ULE), Origin and Age.

Age is a primary consideration as it is the determining factor when considering how long it would take to replace the amenity lost when trees are removed.

Very High	<ul style="list-style-type: none"> • Mature tree in good condition, long lived species with very high amenity value. • Semi-mature or mature rare species in fair to good condition.
High	<ul style="list-style-type: none"> • Semi-mature to mature tree in fair to good condition, long lived species with a high amenity rating. • Juvenile rare species. • Trees of moderate condition that offer exceptional amenity due to factors such as species, size or ecological value.
Medium	All trees that don't fit in the alternative categories and are assessed to have fair/poor or lower rating for either health of structure.
Low	<ul style="list-style-type: none"> • Juvenile trees (not including rare species). • weeds that offer medium or high amenity value.
Nil	Contribution in the landscape is of no value or detrimental – usually associated with small dead or dangerous trees or environmental weeds.

2.4 Limitations

The following limitations apply:

- Excavation at the site was not undertaken. Root condition has not been included unless above ground signs such as soil heaving or cracking were observed.
- Aerial examination (tree climbing) was not undertaken.
- Tree height and canopy width were estimated.
- TPZ calculation within the data table is based on AS 4970 -2009, refer to the City of Whittlesea scattered tree retention practices for applicable TPZ calculation method.
- Nearly all inspected trees contained some amount of deadwood within the canopy, this is normal for most trees and as such, no comment was made regarding low or moderate deadwood as a defect.
- Access to one property was not granted, the property was not inspected.

3 Findings

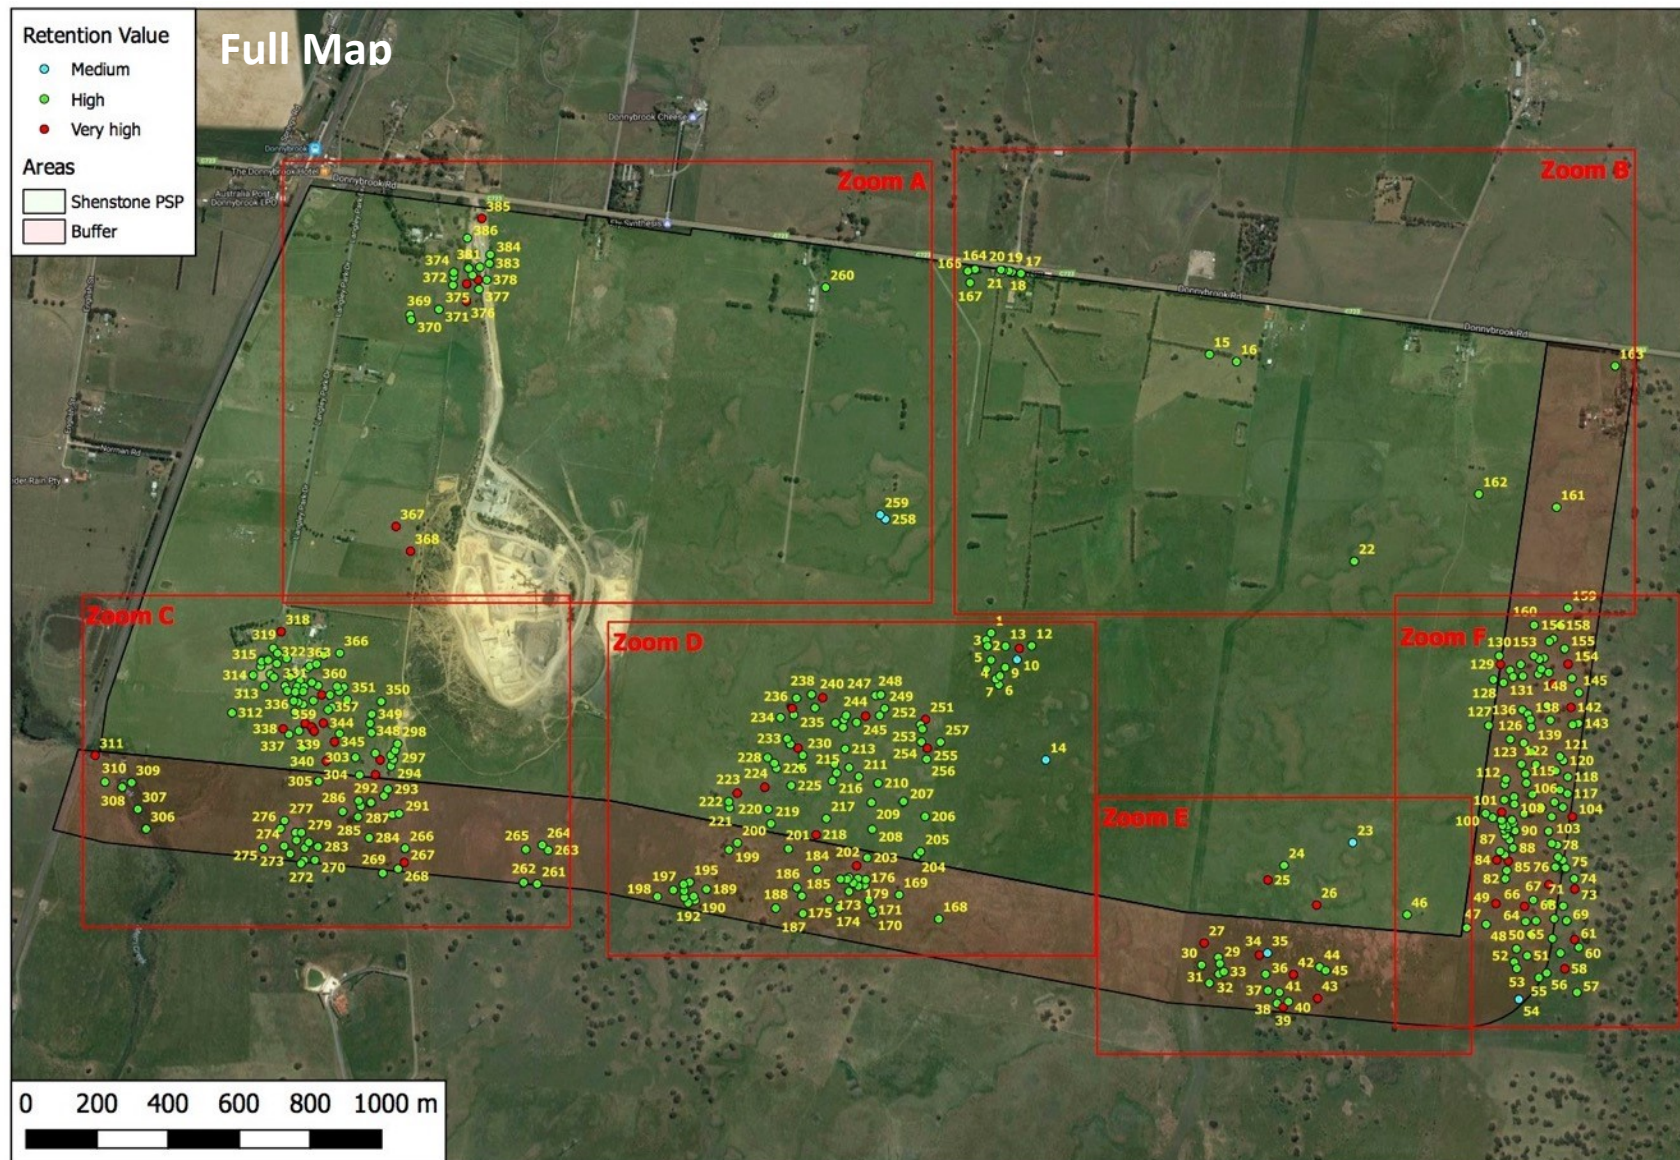

3.1 Assessment area

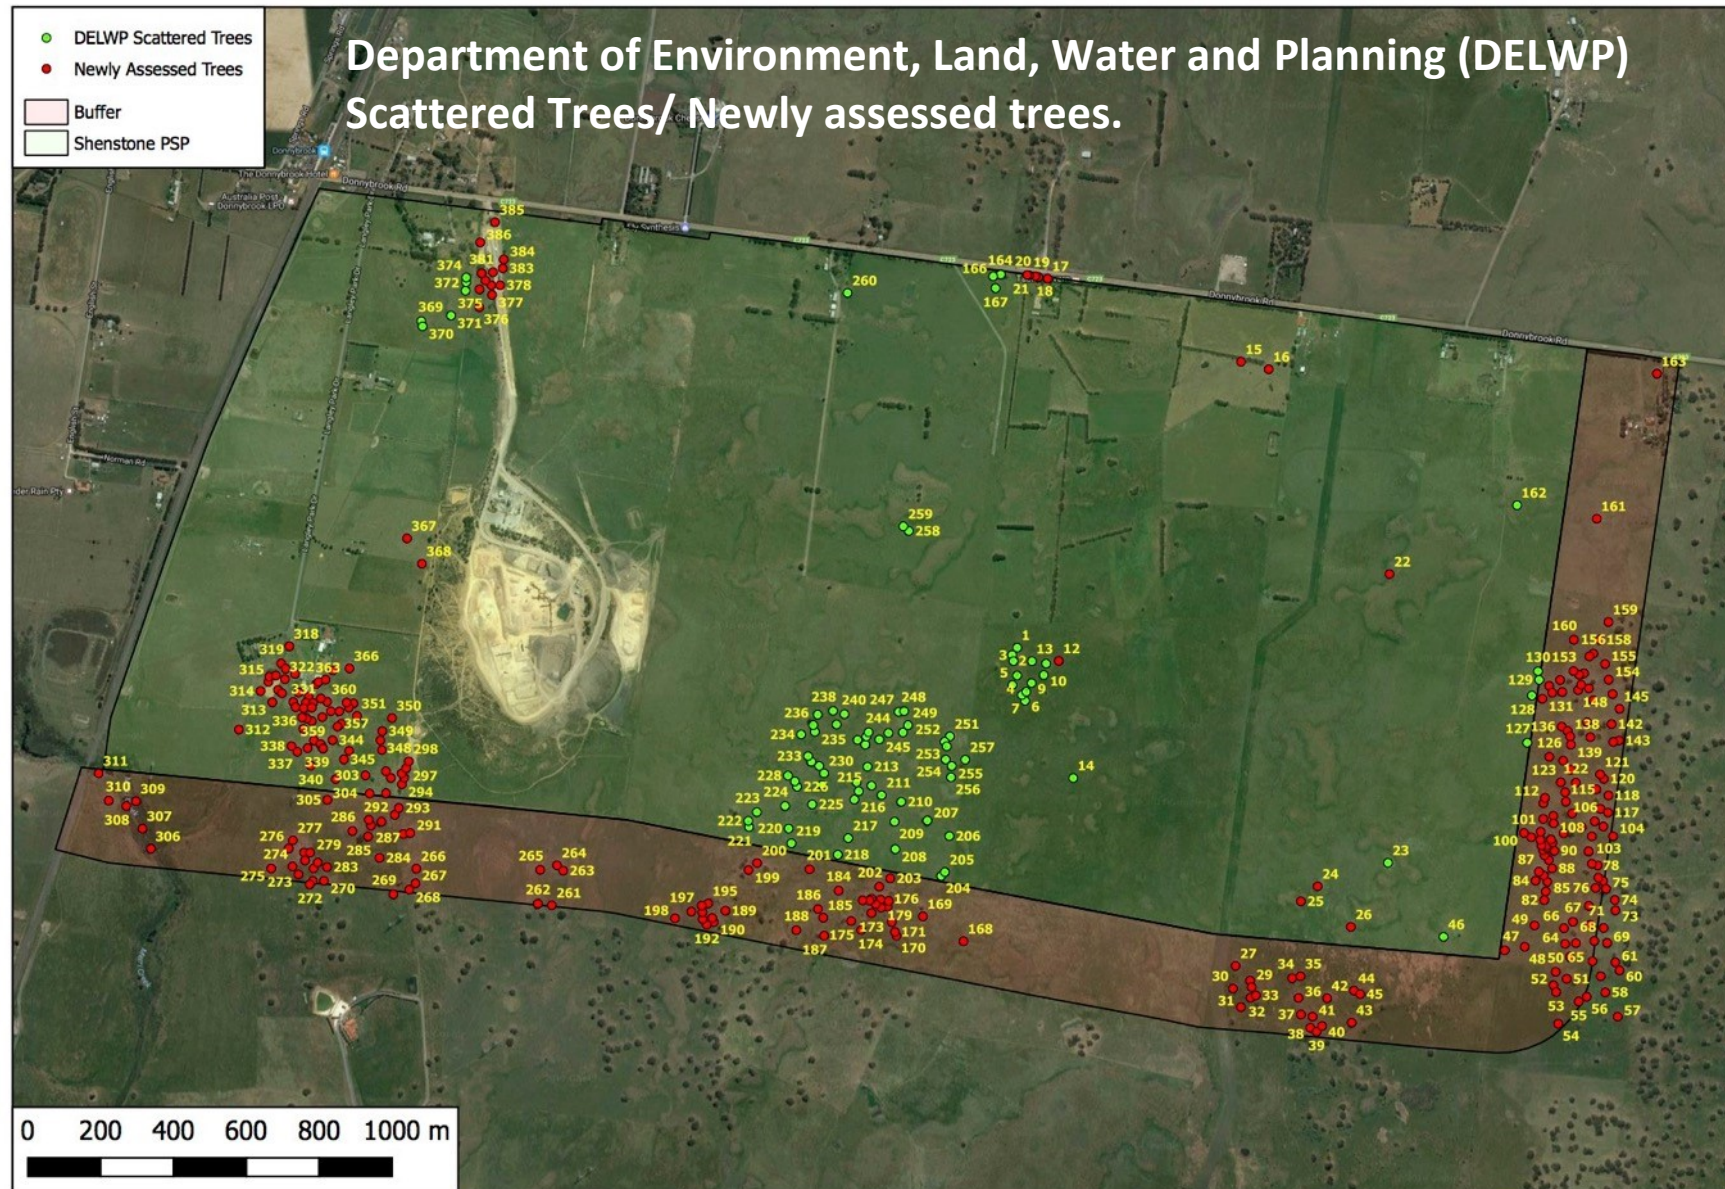

- - Access not granted, area requiring further assessment at the planning permit stage.
- - Area assessed within Shenstone PSP.
- - Additional assessment area (buffer ~250m).

3.2 Shenstone PSP Maps

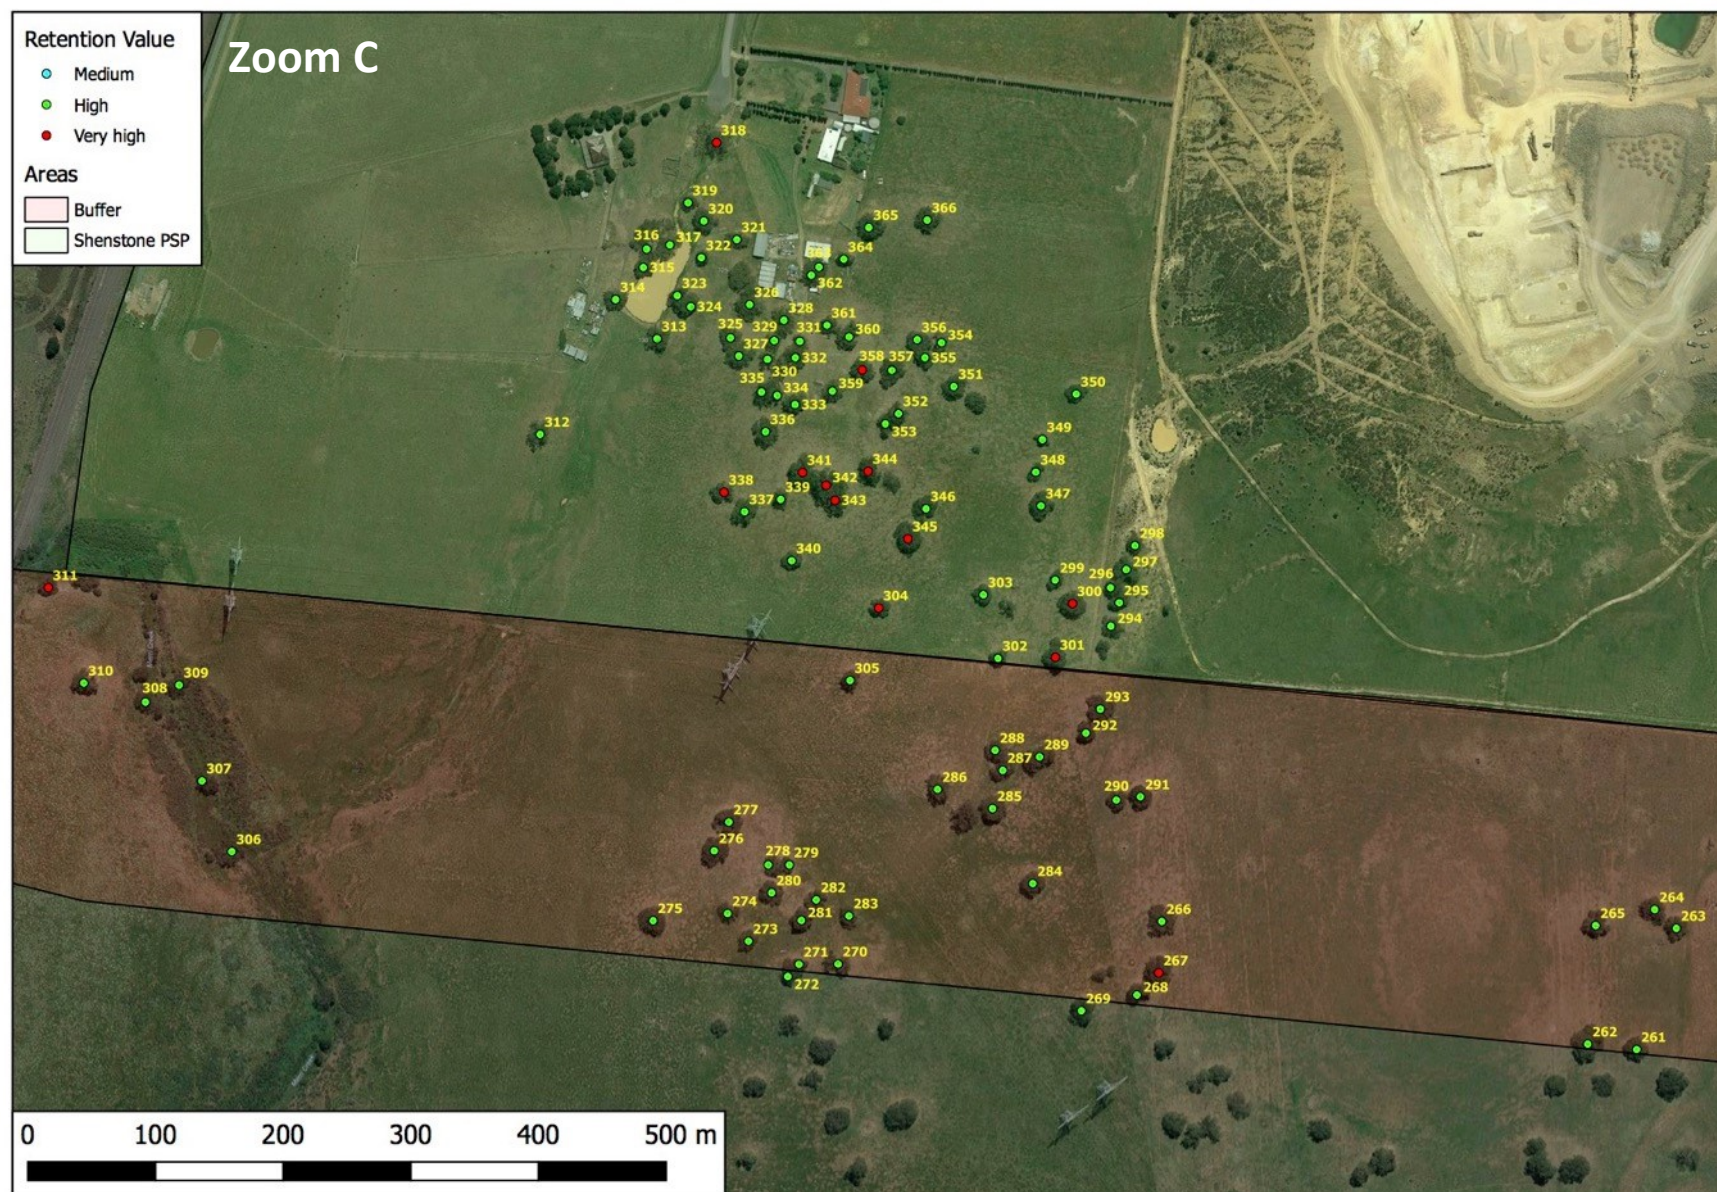

Boundary and buffer lines are indicative only.

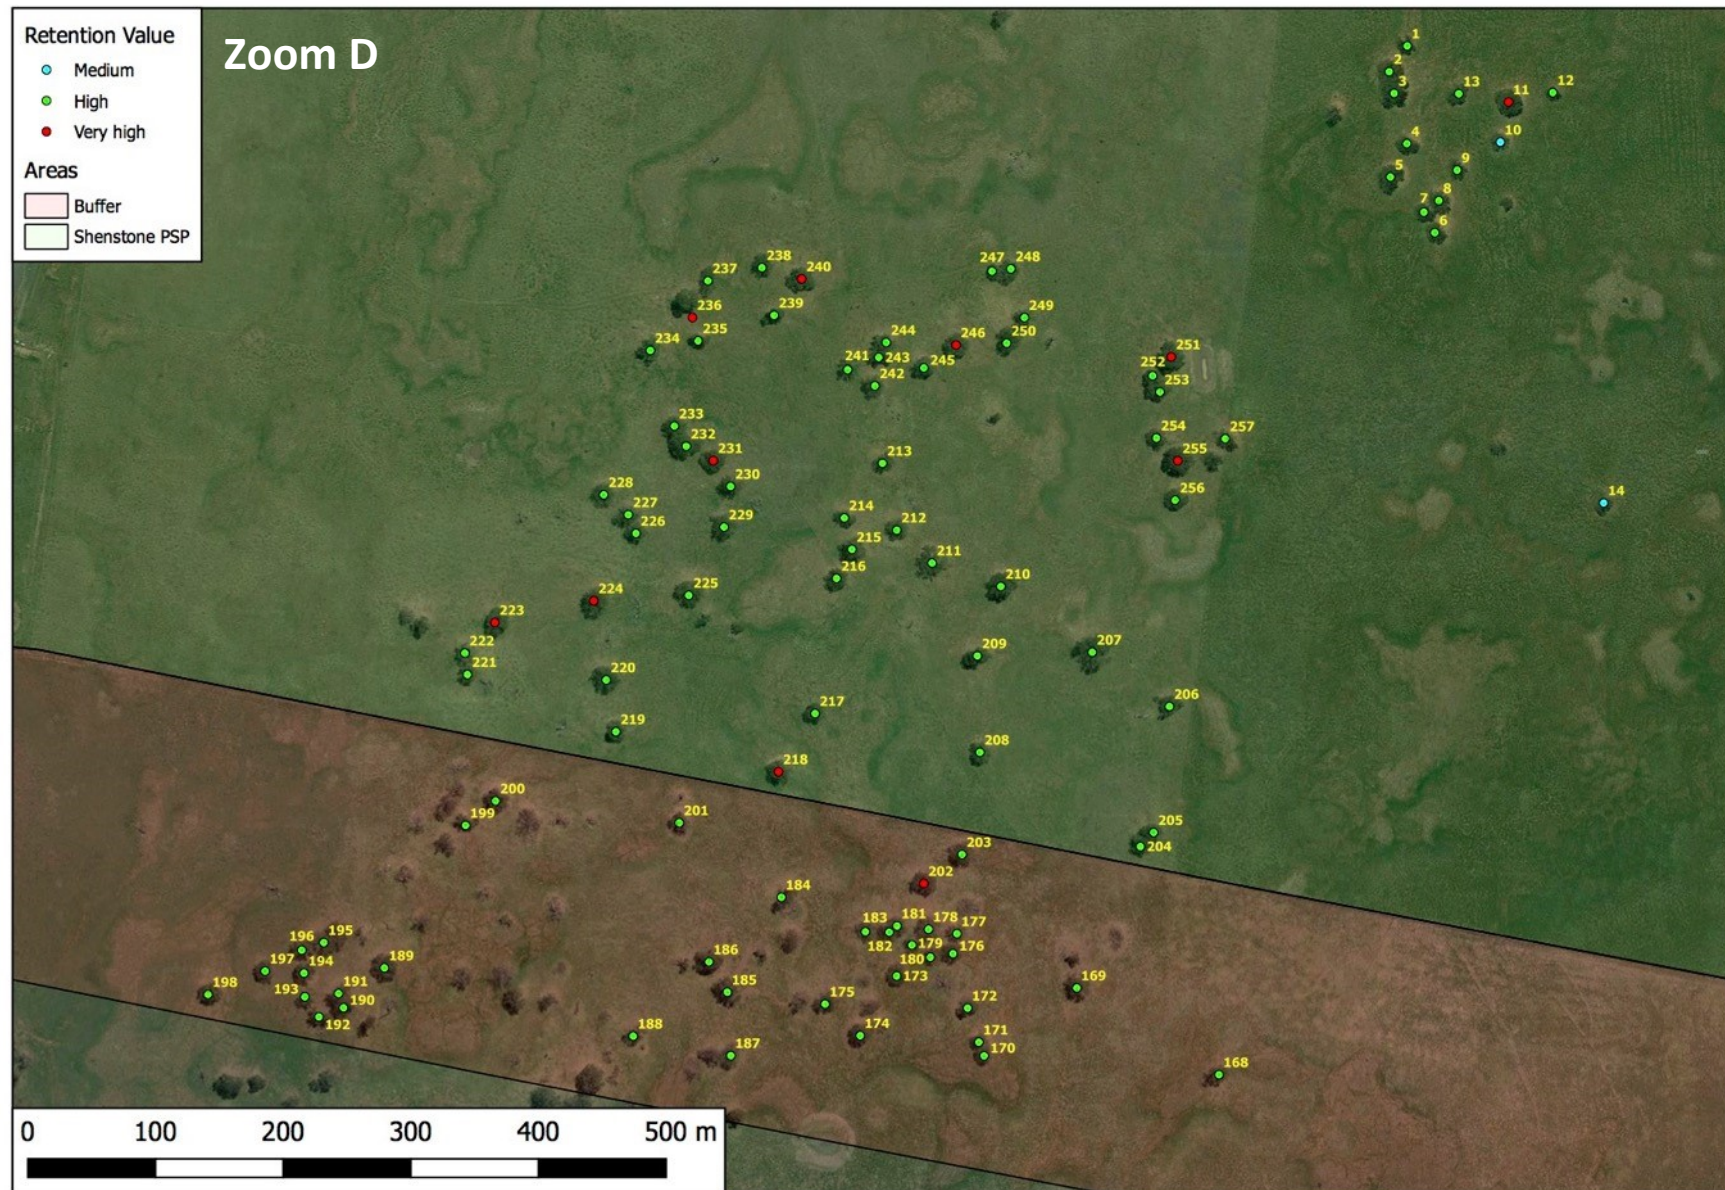

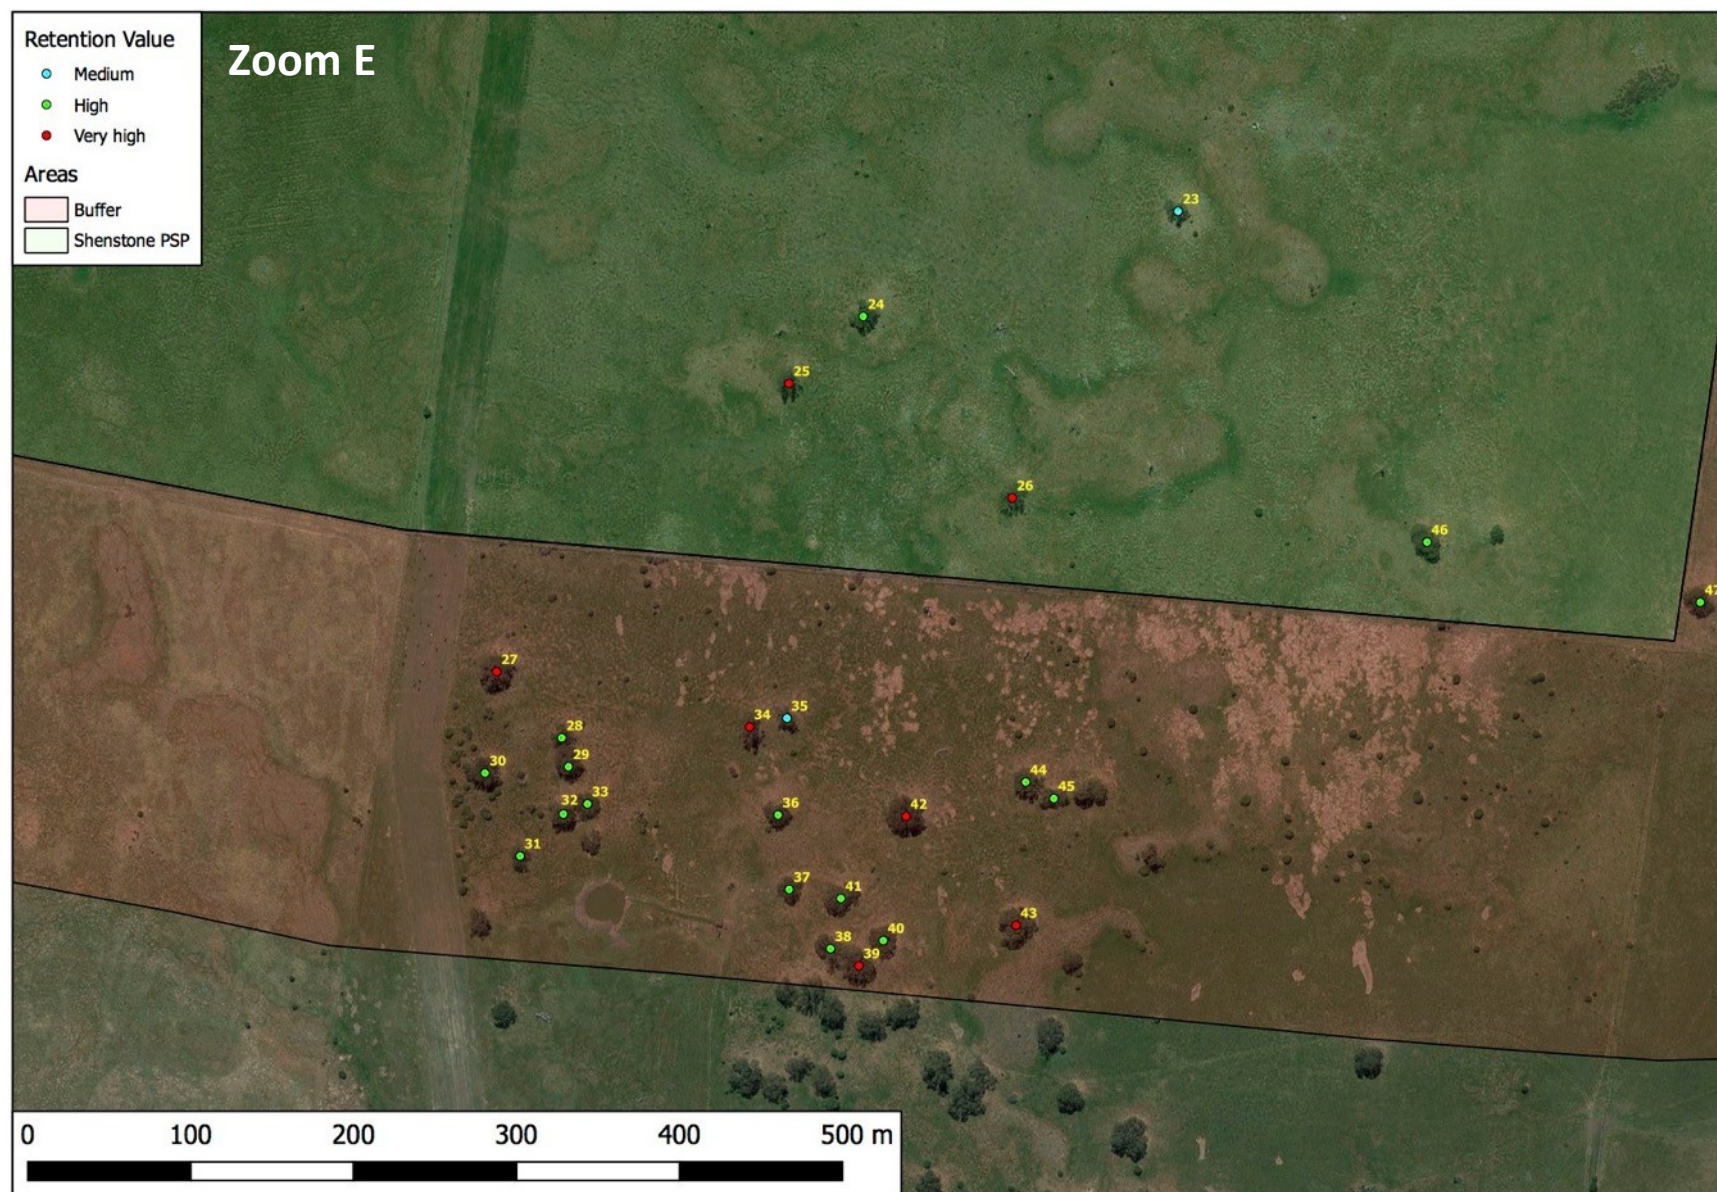

3.3 Photographic examples of excluded trees

Plate 1 – Tree with poor health

Plate 2 – Tree with poor structure. 2013 grassfire damage

Plate 3 – Dead tree

4 Observations / discussions

4.1 Site summary

The area assessed is predominantly open pasture and/or grazing with scattered trees, some areas with a high proportion of invasive weed species.

The dominant tree species was River Red Gum, there were others including non-indigenous native, exotic, and indigenous species scattered across the site. The exotic species are predominantly low ARV and confined to wind rows or private garden space surrounding existing dwellings, there are planted native specimens in clusters or planted along fence lines as wind rows.

The Mountain View Quarry is encompassed within the assessment area. The property contains a number of high ARV trees (# 375-386) in proximity to the main entry gate. The vegetation surrounding the quarry pit is a mix of planted native and exotic species of low-medium significance.

4.1.1 Hybridisation

Eucalyptus camaldulensis is known to hybridise with a number of other species, including *Eucalyptus ovata*. It appears likely that there are trees within this precinct that are hybrids including Tree 26. These hybrids share features of *Eucalyptus camaldulensis* and *Eucalyptus ovata*, although the dominant features observed appear to be *Eucalyptus camaldulensis*. For the purpose of this report these trees have been categorised as *Eucalyptus camaldulensis*.

4.1.2 Medium ARV Trees

Seven (7) trees were included in the data (Appendix 3) that are of medium ARV. These seven trees are outside the scope of this report but are at the high end of the medium classification, and have been included to provide an indication of the boundary between High and Medium ARV. Generally, a large tree would receive a medium rating when structural condition contributed to a higher risk potential.

4.1.3 Site habitat significance

The faunal habitat significance of most trees included within this report was considered to be high to very high. The large River Red Gums assessed typically supported numerous hollows with evidence of faunal habitation in the form of scats, nests and claw marks on trunks. There were a number of trees with notably large nesting material such as sticks and small branches consistent with large birds of prey.

4.1.4 TPZ Calculation (AS / Whittlesea / DELWP)

All trees within this report are within the City of Whittlesea and are therefore subject to the local tree protection calculation. Due to the high significance of River Red Gums, the City of Whittlesea has developed a TPZ calculation method that gives consideration to not only the tree trunk diameter (DBH) but also the tree height, spread and crown shape/extent. Through the Wollert, Quarry Hills and Donnybrook Woodstock PSPs, the Department of Environment Land Water and Planning (DELWP) endorsed the City of Whittlesea's TPZ standards.

The Australian standard (AS4970) TPZ calculation is an area isolated from construction disturbance so that the tree remains viable. Under AS4970 the radius of the TPZ is usually calculated for each tree by multiplying its DBH x 12 (TPZ = DBH x 12).

The Whittlesea TPZ calculation is determined by the shape of the individual tree canopy and

should be applied to all River Red Gums that are to be retained, refer to the City of Whittlesea scattered tree retention practices for the detailed TPZ calculation method.

5 Conclusion

Treetec was commissioned by the City of Whittlesea on behalf of the Victorian Planning Authority to map and assess any trees of high or very high Arboricultural Retention Value that exist within the Shenstone Park 1069.1 boundary and the additional assessment area (buffer) of approximately 250m to the south and east of the PSP area.

The field investigations were undertaken during October and November 2016, one property could not be accessed and (as instructed) data was not included for this site.

The Shenstone precinct supports many very large River Red Gums of significant amenity and ecological value including Hybrid River Red Gum / Swamp Gum. The majority of higher value trees are located in five clusters (see maps in section 3), these clusters overlap from the assessment area into the buffer to the south and east.

A total of 379 trees were identified as being of high or very high ARV. The dominant species being River Red Gum, (*Eucalyptus camaldulensis*).

- Fifty-one (51) trees were assessed as very high ARV.
- Three hundred and twenty-eight (328) as high ARV.

All River Red Gums within the City of Whittlesea have region specific protection requirements under the Shires regulations (Clause 22.10); including the calculation of Tree Protection Zones using the Whittlesea council's method. (Ref. Technical Note 1 – issued November 2014: REV A and refer to SDL.2.01.)

6 Recommendations

All trees should be considered during the initial design stages of the site subdivision, and adequate space allocated to higher value individual trees and clusters of trees to avoid development related impacts.

Plans should be cognisant of the increased risk associated with large old trees, designs should not result in increased public use of the areas under or surrounding trees.

8 Assumptions and limiting conditions

1. **Treetec** does not assume responsibility for legal matters, and assumes that legal descriptions, titles and ownerships are correct and good.
2. **Treetec** assumes that any property or project is not in violation of any applicable codes, ordinances, statutes or other government regulations.
3. **Treetec** takes all reasonable care to ensure all referenced material is accurate and quoted in correct context but does not take responsibility for information quoted or supplied.
4. **Treetec** shall not be required to give testimony or to attend court by reason of this report unless subsequent contractual arrangements are made, including the payment of an additional fee for such services.
5. Loss or alteration of any part of this report invalidates the entire report.
6. Possession of this report, or a copy thereof, does not imply right of publication or use for any purpose by anyone but the person to whom it is addressed, without the prior written consent of **Treetec**.
7. All, or any part of the contents of this report, or any copy thereof, shall not be used for any purpose by anyone but the person to whom it is addressed, without the written consent of **Treetec**.
8. This report shall not be conveyed by anyone, including the client, to the public through advertising, public relations, news, sales or other media, without the written consent of **Treetec**.
9. This report and any values expressed herein represent the opinion of **Treetec** and **Treetec's** fee is in no way contingent upon the reporting of a specified value, the occurrence of a subsequent event, nor upon any finding to be reported.
10. Site plans, diagrams, graphs and photographs in this report, being intended as visual aids, are not necessarily to scale and should not be construed as engineering or architectural reports or surveys.
11. Information in this report covers only those items that were examined in accordance with the Terms of Reference, and reflects the condition of those items that were examined at the time of the inspection.
12. The inspection is limited to visual examination of accessible components unless otherwise stated in the "Method of Inspection".
13. There is no warranty or guarantee, expressed or implied, that the problems or deficiencies of the plants or property in question may not arise in the future.

9 Appendix 1. Glossary

AGE CATEGORY	<p>The age of the tree is represented as Juvenile, Semi-mature, Mature or Senescent.</p> <hr/> <p>Juvenile: A young tree, given normal environmental conditions for that tree it will not yet flower or fruit.</p> <hr/> <p>Semi-mature: Able to reproduce but not yet nearly the size of a mature specimen in that location.</p> <hr/> <p>Mature: Has reached or nearly reached full size and spread for that species in the given location.</p> <hr/> <p>Senescent: Has passed maturity, tree health in a state of decline.</p>
AMENITY VALUE	<p>A judgment of amenity and/or utility the tree provides based on Species, size, Age, Health and local environment. Amenity may be based on ecological or landscape value or both.</p> <p>Documented as Low, Medium or High.</p> <p>Amenity value does not consider the degree of risk associated with a tree, a weedy species will not be rated as High for Amenity value.</p>
ARBORICULTURAL RETENTION VALUE	<p>A rating assigned to a tree or group of trees related to the value of retaining those trees in situ. The judgement is based on Tree condition (Health, Structure & Form), Useful Life Expectancy (ULE), Origin and Age.</p> <p>Age is a primary consideration as it is the determining factor when considering how long it would take to replace the amenity lost when trees are removed.</p> <hr/> <p>Very High</p> <ul style="list-style-type: none"> • Mature tree in good condition, long lived species with Very High Amenity value • Semi-mature or mature rare species in fair to good condition <hr/> <p>High</p> <ul style="list-style-type: none"> • Semi-mature to Mature tree in good condition, long lived species with a high Amenity rating • Juvenile rare species • Trees of moderate condition that offer exceptional amenity due to factors such as species, size or ecological value <hr/> <p>Medium</p> <p>All trees that don't fit in the alternative categories and are assessed to have fair/poor or lower rating for either health of structure.</p> <hr/> <p>Low</p> <ul style="list-style-type: none"> • Juvenile trees (not including rare species) • weeds that offer Medium or high amenity value <hr/> <p>Nil</p> <p>Contribution in the landscape is of no value or detrimental – usually associated with small dead or dangerous trees or environmental weeds</p>
CAMBIUM LAYER	<p>A layer of cells between the bark and wood tissue that divide to form new cells. Usually a slimy green layer just under the bark.</p>
CANOPY SPREAD	<p>Overall size of the canopy as looking from a plan view. Recorded at the widest point.</p>
CO-DOMINANT STEMS	<p>Two stems of approximately the same thickness and height originating from the same position in the tree.</p>

DBH (Diameter at Breast Height)	The diameter of the trunk measured at or near 1.4m above ground level. Where there is more than 1 stem originating below 1.4m the measurement recorded is calculated as described in AS 4970-2009
DEAD (AS DEAD)	Cessation of all metabolic processes (or very soon to be)
DE-OXYGENATION	A lack of oxygen, normally referring to the state of the soil
EPICORMIC SHOOTS	Re-growth from the trunk or branches, originating from dormant buds under the bark, usually poorly attached, often an indicator of tree stress.
FORM	Reference to the symmetry of the crown as observed from all angles and in accordance with the morphology of that species, and documented as Poor, Fair or Good.
HAZARD	Anything that has the potential to cause injury or damage
HEALTH	A trees vigour as exhibited by the crown density, leaf colour, seasonal extension growth, presence of stress indicators, ability to withstand diseases and pests, and the degree of dieback.
	Dead: Cessation or near cessation of all metabolic processes
	Poor: Indicating symptoms of extreme stress such as minimal foliage, or extensively damaged leaves from pests and diseases. Death probable if condition of tree deteriorates.
	Fair: Not nearly of 'Good' condition (see below)
	Good: Usual for that species given normal environmental conditions – full canopy with only minor deadwood, normal leaf size and extension growth, minimal pest or disease damage
	Excellent: Better than usual for that species under normal conditions
HEIGHT	The distance in metres from the ground to the highest point in the crown, calculated in the vertical plane. This measurement unless otherwise specified is an estimation only.
INCLUDED BARK UNION	A union within a tree that has included bark (bark pressing on bark), these unions are usually poorly attached and more likely to fail as the included bark is equivalent to a split. Often characterized by an acute angle and sometimes forming ribs or flaring immediately below the union where the tree reacts to the weakness by placing secondary growth. Though these unions are weaker than a 'good' union, the risk of failure cannot be calculated.
LOPPING / TOPPING	The removal of parts of a tree giving no consideration to the trees natural defence systems.
ORIGIN/TYPE	Origins of the species related to its setting – <u>Indigenous</u> is native to that location, <u>Non-indigenous Native</u> is Australian but not local, <u>Exotic</u> is not from Australia. Sometimes a classification of <u>Weed</u> will be assigned; this indicates that the species is generally unwanted within this geographic area (regardless of origin)
PATHOGEN	Disease causing agent
PRUNING	Systematic removal of branches of a plant whilst giving consideration to the trees natural defence systems.
RETENTION VALUE	See 'Arboricultural retention value'
RISK	The chance and degree of injury or loss presented by a hazard

STRUCTURE	<p>Reference to the structural integrity of the tree with consideration of the crown, trunk and roots. Determined using the Visual Tree Assessment (VTA) method (Mattheck and Breloer 1994) . The failure of small (<60mm calliper) live or dead limbs is normal and not considered here.</p> <hr/> <p>Very poor: Clear indications that a significant failure is likely in the near future</p> <hr/> <p>Poor: Signs of structural weakness obvious and failure likely, one might expect a significant failure event within the next 5 years, possibly tomorrow</p> <hr/> <p>Fair: Signs of weakness present though not obviously significant, likely to become worse over time</p> <hr/> <p>Good: No obvious signs of structural weakness</p>
TREE NUMBER	Identifying number allocated to individual trees or groups of trees, may be used to locate trees using site plans or tags on trees.
TREE PROTECTION ZONE (TPZ)	<p>An exclusion area that allows for protection of canopy and roots; both the structural roots that give the tree stability and the smaller absorption roots. The radius of the TPZ is normally calculated for each tree by multiplying the DBH × 12. The minimum distance will be 2m and maximum 15 as stipulated in the Australian Standard 4970-2009 – Protection of trees on development sites.</p> <p>For River Red Gums within Whittlesea City Council boundaries, the City of Whittlesea Tree Protection Zone calculation method must be applied</p>
TREETEC REFERENCE	Unique identifier assigned to an individual report by Treetec
ULE	<p>Useful Life Expectancy is an estimation of how many years a tree can be retained in the landscape provided growing conditions do not worsen and any recommended works are completed.</p> <p>It takes into consideration factors such as species, age, health, defects / hazards and site conditions.</p>

10 Appendix 2. General Comments

10.1 Hazards and Risk

Large old trees present hazards, in particular from falling limbs, this should be considered and managed in accordance with the City of Whittlesea scattered tree retention policy.

Risk assessment of trees relies on an appraisal of the structural integrity of a tree in conjunction with the likelihood of tree failure (either whole tree or limbs) adversely impacting people or property.

Risk for the assessed trees, included in this report, at the time of inspection was considered to be low; however, once development is introduced, the risk will increase as targets and occupancy under or around trees increases.

Once development is complete and TPZ measures (fencing) are removed, all retained trees should be assessed for hazards and risk; any tree related hazards should be addressed prior to use of the area.

10.2 Controlling risk

Risk mitigation measures may include:

- Pruning to remove weak or damaged components of a tree.
- Locating of targets such as seating, paths or playgrounds away from under or near trees.
- Fencing areas to exclude people from under trees - conservation reserves around trees which limit access.
- Appropriate signage.
- Improving growing conditions by providing adequate space between development and trees.

Though branch shedding and tree failure cannot be eliminated, by implementing regular hazard inspections as well as risk assessment and control, failure events and therefore risk, will be significantly reduced.

Treetec have been advised of the City of Whittlesea's adopted management practices in regards to tree risk. These practices are conducted in accordance with AS4373 – 2007 and under supervision of a qualified arborist, and have been successfully implemented within a number of residential estates throughout the municipality.

10.3 Tree age

The size of a tree has a strong influence on its retention value. Typically, the larger a tree the higher the retention value. Age is important in determining how long it would take to replace the amenity that a specific tree provides. Hence it would be unusual for a juvenile tree to attract a high or very high ARV rating.

10.4 Maintaining Tree Protection Zones (TPZ)

Where it is determined that a TPZ is to be established, the area should be fenced prior to commencement of nearby demolition / construction work, this TPZ exclusion area must be protected; no materials, equipment, waste, chemicals or vehicles are to be stored or parked within this area. The soil profile and level within the TPZ should not be disturbed or altered.

If at any time, the TPZ may need to be infringed upon for works such as, excavation for the installation of pipes or drainage, or the movement of equipment, or any other interference that may cause a change in the availability of water or oxygen to the tree, a suitably qualified Arborist should be consulted to direct and supervise the works.

It may be possible to work within a TPZ without significantly impacting a tree, however, the size and number of roots in the area would need to be determined prior to commencement, and design and construction methods must be tree sensitive.

10.5 Soil compaction

Soil compaction reduces the number and size of soil pores, subsequently reducing the available water and oxygen to a tree, this then impedes a tree's ability to respire (consume reserved energy supplies) and increases stress. Subsequent symptoms may include thinning or dying crown, reduced or no seasonal extension growth, limb shed or death of the tree. Insect infestation may increase as a tree's natural ability to withstand pests is diminished.

10.6 Physical / mechanical damage to trees

Physical damage to tree parts, particularly the trunk, is unsightly and provides entry points for pests and diseases such as fungal infections. This may cause long-term decay and can lead to partial or complete tree failure and death.

10.7 Alteration of soil levels

Alteration of soil levels around trees will affect the root zone and stability of a tree as well as tree metabolism. This may result in reduced tree health, excessive deadwood, thinning foliage and poor vigour; it can take some years for the impact to become evident at which time it is normally irreversible.

10.8 Pruning standards / Lopping

An Australian standard exists to give guidance on the pruning of trees, the objective of the standard is to provide arborists, tree workers, government departments, and contractors with a guide defining uniform tree pruning procedures and practices in order to minimise the adverse or negative impact of pruning on trees. It is important that all tree works are carried out by a competent contractor in accordance with the Australian Standard. (AS. 4373 2007 - Pruning of Amenity Trees).

Lopping as defined within the standard, is detrimental to trees and often results in decay and poorly attached epicormic shoots. Natural target pruning methods, as per AS 4373 2007 should be used wherever possible when removing sections from trees.

11 Appendix 3. Tree Data

51 Very High ARV trees

328 High ARV trees

7 Medium ARV trees (indicative samples only)

TREE #	SPECIES	TYPE	DBH (CM)	HEIGHT (M)	SPREAD (M)	AGE CATEGORY	HEALTH	STRUCTURE	TPZ	ULE (YRS)	RETENTION VALUE	NOTES	LATITUDE	LONGITUDE	DELWP ID
