Victorian Planning Authority Officer South

### **Executive Summary**

Homewood Consulting Pty Ltd has been engaged by the Victorian Planning Authority (VPA) to assess and report on trees located within defined areas in the Officer South Employment Precinct. This report focuses on identifying high value trees to inform the development of the Officer South Employment Precinct Structure Plan (PSP).

The Preliminary Tree Assessment is an arboricultural report which provides an assessment of the existing trees on a property in order to assist the preparation of a development design. It is not an assessment of the impact of proposed development on the trees and is not intended to accompany a planning permit application to council.

Prior to the submission of a planning permit application, a 'Construction Impact Assessment' is recommended. This will enable impact on trees intended for retention to be determined and provide case specific advice concerning impact mitigation.

In total 10,430 trees were assessed as part of this proposal, with a further 53 inaccessible trees noted as potentially 'High' retention value.

Retention Category	No of Trees
Very High	16
High	699
Medium	3993
Low	5722
Total	10430

Table 1: Retention Values for assessed trees

Trees assessed with a 'Very High' or 'High' retention value are the most significant trees on site and all reasonable efforts should be made to retain them in the landscape with any design proposal. Each of these trees was assessed using a 'Visual Tree Assessment' (VTA), they were photographed and their details recorded.

Trees assessed with a 'Medium' retention value are mainly mature trees with structural faults that reduce their useful life expectancy or semi-mature specimens well established and in good condition. Trees assessed with a 'Low' retention value are trees with 'Poor' health and/or structure, weed species, young/small trees easily replaceable or trees not suitable to be retained with a new development.

Groups of 'Medium' and/or 'Low' retention value trees were recorded. However, for each group only a count of the total number of 'Medium' retention, 'Low' retention, Native, and Exotic trees within the group was recorded.

#### It is recommended that:

- 16 'Very High' retention value trees and 699 'High' retention value trees are retained and incorporated into final design plans.
- As many 'Medium' retention value trees as possible are incorporated into the design.
- Low retention value trees are not considered a constraint on the design process for this site.
- A Construction Impact Assessment Plan and Tree Protection Management Plan are undertaken following finalisation of design plans. This will enable impact on trees intended for retention to be determined and provide case specific advice concerning impact mitigation.

#### **Preliminary Tree Assessment**

Victorian Planning Authority Officer South

- TPZs for trees to be retained are shown on all design plans.
- The design team is made fully aware of the location of the trees to be retained including all appropriate tree protection measures prior to beginning the design process, particularly Tree Protection Zone (TPZ) guidelines, dimensions and requirements.
- The proposed design has minimal impact to the canopy and root systems of retained trees does not encroach on the specified TPZ of any retained trees. If this cannot be achieved, any encroachment exceeding 10% of the TPZ area, and/or within the SRZ must be assessed by a qualified arborist who will demonstrate how (or if) the tree will remain viable.
- TPZ specifications and guidelines outlined in Section 7 and Appendix 3 should be followed to ensure that all retained trees are adequately protected prior to, during and following the proposed construction.
- Prior to the commencement of works, including demolition and the removal of existing trees, TPZ fencing is erected around all trees to be retained and inspected by a qualified arborist to ensure it is adequate.
- Where trees are to be retained, pruning may be required. All pruning should be carried
  out by a fully qualified arborist experienced in pruning mature trees. The minimum
  qualification should be:
  - ♦ A National Certificate in Horticulture (Arboriculture) AQF Level 4.
  - All pruning must conform to the Australian Standard Pruning of Amenity Trees (AS 4373-2007).

### 1. Introduction

Homewood Consulting Pty Ltd has been engaged to provide a Preliminary Tree Assessment report as part of the technical background studies for the Officer South Employment Precinct Structure Plan (PSP).

Site planning is in the preliminary stages with the Victorian Planning Authority (VPA) facilitating the development of the Officer South Employment Precinct.

The Officer South Employment Precinct is located approximately 45km southeast of Melbourne's CBD, within the municipality of Cardinia. The precinct covers an area of about 1069 hectares, bound by Cardinia Creek to the west, the Princes Freeway to the north, Lower Gum Scrub Creek to the east and the Urban Growth Boundary to the south.

An arborist report is required to assess the health, condition and arboricultural retention value of the trees. This report will inform the preparation of the Precinct Structure Plan through identifying trees worthy of retention in the proposed landscape.

This report provides Tree Protection Zone (TPZ) dimensions, Structural Root Zone Dimensions (SRZ) and design considerations in accordance with the Australian Standard (AS 4970-2009) *Protection of Trees on Development Sites* for the subject trees.

Site maps including the assessment boundaries for each site are shown in Section 0.

Figure 1: Example of the rural properties of which the Officer South Employment Precinct is currently comprised.

# 2. Key Objectives

- Identify trees worthy of retention within the Officer South Employment Precinct assessment area.
- Provide an assessment of the identified trees with regard to their health, structure and retention value in the landscape.
- Provide preliminary recommendations for tree protection that should be incorporated in the design and construction process.

#### 3. Method

From Monday 11th to Wednesday 20th May 2020 John Brennan and Tim Oldfield conducted site inspections.

### 3.1 'High' or 'Very High' retention value trees

The following data was collected for trees with a 'High' or 'Very High' retention value located on land that could be accessed. Or alternatively, they were located on land that could not be accessed but the tree could be clearly seen and assessed from a short distance away on an adjoining property.

Data collected for the trees included:

- Botanical Name
- Canopy Dimensions
- Diameter at Breast Height (DBH)
- Diameter at Base (DAB)
- Health

- Structure
- Useful Life Expectancy (ULE)
- Landscape Contribution
- Retention Value

A 'Visual Tree Assessment' (VTA) was conducted for each tree. A VTA consists of a detailed visual inspection of a tree and its surrounding site, including a complete walk around the tree, looking at the buttress roots, trunk, branches and leaves. The tree is observed from a distance and close up to consider crown shape, landscape context and surroundings.

The assessment was conducted from ground level with no instruments used other than a diameter tape to measure trunk diameter. Any assessments of decay are qualitative only.

Tree location was recorded using differentially corrected GPS (generally +/- 1.0m accuracy).

The table in Appendix 5 shows the data collected for the trees. For definitions and descriptors of the data collected on site see Appendix 1.

#### 3.1.1 Trees that could not be accessed

Where there appeared to be trees with a 'High' or 'Very High' retention value but the tree could not be accessed and was not visible enough to conduct a VTA, a data point was recorded to identify the locations of Potential 'High' or 'Very High' retention value trees.

Figure 2: Green dots representing High retention value trees accessible from a public road, blue diamonds indicating Potential High retention value trees that could not be accessed, and orange hatching indicating groups of moderate and low retention value trees

#### 3.2 'Medium' or 'Low' retention value trees

'Moderate' and 'Low' retention value trees are generally those with poorer health, structural defects, and/or are small to medium sized trees that can easily be replaced in the landscape. Therefore, in line with the stated objective to identify trees worthy of retention within the Officer South Employment Precinct, data collected for these trees was much more general in nature.

Where groups of trees were encountered, the approximate location of the group was recorded. For each group the number of 'Moderate' retention trees, 'Low' retention trees, Exotic species trees, and Native species trees was counted and recorded.

The assessment of 'Moderate' and 'Low' retention value trees was not exhaustive and only groups of trees were recorded. Scattered individual 'Moderate' and 'Low' retention value trees were not assessed.

#### 3.3 Land Access

In general, property owner and / or access consent details have been provided by VPA. Where no access or property details have been received, access attempts were made via doorknocking.

The Officer South Employment Precinct consists of 48 individual land parcels. Of these land parcels;

- Four are located entirely outside the arboriculture assessment area specified by VPA and so did not need to be assessed.
- 11 land parcels could not be accessed because either the landowners could not be contacted or an agreement between the landowners and VPA could not be reached.
- 6 were not accessed because access was not considered necessary. A combination of observations from the property boundary and desktop assessments using aerial photography indicated these areas did not contain any 'High' or 'Very High' retention value trees.
- The remaining 27 land parcels were all accessed with landowner consent.

The following table lists each land parcel, the address, and whether or not they were accessed.

Land Parcel Number	Property Address	Accessed
1		NO- not necessary, outside assessment area
2	90 Handford Lane	YES
3	90 Handford Lane	YES
4	ATM 1/94 Princes Fwy	YES
5	20 Handford Lane	YES
6	20 Handford Lane	NO- not necessary, Low and Medium trees only
7	Stephens Rd	NO- not necessary, Low and Medium trees only
8	190 Officer South Rd	YES
9	Officer South Rd	NO- not necessary, Low and Medium trees only
10	200 Officer South Rd	NO- no contact details
11	185 Officer South Rd	YES
12	90 Handford Lane	YES
13	Handford Lane	NO- no contact details

Table 2: Land parcels within the Officer South Employment Precinct

Land Parcel Number	Property Address	Accessed
14	Handford Lane	NO- no contact details
15	Stephens Rd	YES
16	130 Stephens Rd	YES
17	125 Stephens Rd	NO- not necessary, Low and Medium trees only
18	135 Stephens Rd	YES

42	425 Officer South Rd	YES
43	Officer South Rd	NO- not necessary, Low and Medium trees only
44	425 Officer South Rd	YES
45	425 Officer South Rd	YES
46	425 Officer South Rd	YES
47	105 Patterson Rd	YES
48	Patterson Rd	NO- access not granted

### 3.4 Melbourne Strategic Assessment Scattered Trees

In addition to the trees assessed by Homewood Consulting, VPA have provided location data for scattered trees assessed by the Department of Environment, Land, Water and Planning (DELWP) as part of the Melbourne Strategic Assessment (MSA). Where there are MSA scattered trees which have not been assessed by Homewood Consulting, VPA has stated that these trees should be considered high value trees for biodiversity reasons and retained wherever practical. These MSA tree locations are shown in the site overview map in Section 4 and the TPZ maps in Appendix 6.

#### 5. Site Details

The land within the Officer South Employment Precinct contains some large residential blocks but is predominantly used for rural activities, such as grazing and horse agistment. A number of the rural properties are no longer operating as farms and are owned by property development groups.

In line with the rural nature of the area, much of the land consists of open paddocks containing few trees. The majority of trees within the assessment area have been planted for windbreaks/shelter belts, around residences for amenity and screening purposes, or are located along roadside verges.

Figure 3: Typical open farm paddock with tree plantings lining the perimeter

### 5.1 Planning Overview

Clause 52.17 of the Victorian Planning Provisions seeks to preserve and retain native vegetation – a planning permit is required to 'remove, destroy or lop native vegetation'.

Any vegetation that is native to Victoria requires a permit prior to tree works taking place as described above. Of the species recorded on site, this includes the following: *Eucalyptus camaldulensis, Eucalyptus melliodora, Eucalyptus ovata, Eucalyptus radiata,* and *Eucalyptus viminalis.* 

Of the exemptions listed in the clause and schedules to the clause, there are several exemptions that may apply such as vegetation that is dead, planted or regrowth vegetation.

#### 6. Tree Details

In total 10,430 trees were assessed as part of this proposal, with a further 53 inaccessible trees noted as Potentially High retention value.

- 715 trees have been subjected to a full 'Visual Tree Assessment' (VTA), photographed and had their details recorded. All of these trees have been deemed to be of 'High' or 'Very High' retention value.
- 237 groups of trees were recorded containing a cumulative total of 5,722 'Low' retention value trees and 3,993 'Medium' retention value trees.

### 6.1 Retention Value Overview

Table 3 below sets out the retention value definitions used to categorise trees assessed within the precinct.

Table 3: Retention value category definitions

Retention Value	Definition
Very High	A mature tree of exceptional quality in good condition. A prominent landscape feature with very high amenity value and/or a prominent remnant specimen or other significance (Aboriginal significance). This also includes Semi-mature or Mature rare species in fair to good condition  All efforts should be made to retain the tree and protect from construction impact.
High	Tree of high quality in good to fair condition, including Semi mature long lived species with high amenity rating and Juvenile rare species. Trees of moderate condition include specimens that offer exceptional amenity due to factors such as species, size or ecological value.  All efforts should be made to retain the tree and protect from construction impact.
Medium	Tree of moderate quality in fair condition and generally a modest landscape feature. These include all trees that don't fit in the High or Very High categories and are assessed to have fair/poor or lower rating for either health or structure. These trees have the potential to be a medium to long-term landscape component where managed appropriately.  Where practical, design modifications should be considered in order to retain and protect from construction impact.
Low	Either: Tree of low quality in poor condition and weeds that offer low, medium or high amenity value. These trees are unlikely to be a long or medium term landscape component. Or: Juvenile trees (not including rare species) of good or fair condition which are easily replaced in the landscape through planting of advanced stock.

The total number of trees recorded within each retention value category is listed in Table 4 below. The above listed retention value definitions are also included with the other data collection definitions and descriptors in Appendix 1.

Table 4: Summary of Retention value

<b>Retention Category</b>	No of Trees
Very High	16
High	699
Medium	3993
Low	5722
Total	10430

### 6.2 High and Very High Retention value trees

Trees in these categories are generally large trees and the most significant trees on site. All efforts should be made to incorporate these trees into any new development/design. These trees are all specimens with good or fair health and structure and a high or medium landscape contribution. They are expected to be assets in the landscape for the long-term

699 'High' and 16 'Very High' retention value trees have been recorded. Of the total 715 trees, 27% are indigenous (native to Victoria), 39% are native to Australia, and the remaining 34% are exotic species. The most commonly recorded species was the exotic Hesperocyparis macrocarpa (Monterey Cypress) with 129 individuals, closely followed by the native Eucalyptus botryoides (Southern Mahogany) with 120 individuals. The large number of Hesperocyparis macrocarpa found within the precinct can be attributed to the common use of this species in hedgerows/windbreaks along property boundaries.

For an overview of the common species refer to Table 5 below.

**Botanical Name Number of Individuals Common Name** Hesperocyparis macrocarpa 129 Monterey Cypress Eucalyptus botryoides Southern Mahogany 120 Eucalyptus camaldulensis River Red Gum 86 Corymbia maculata Spotted Gum 81 58 Quercus canariensis Algerian Oak Eucalyptus ovata Swamp Gum 46 Eucalyptus viminalis Manna Gum 42 Eucalyptus cladocalyx Sugar Gum 30 Quercus robur English Oak 29 Pinus radiata Monterey Pine 18

Blue Gum

Table 5: Summary of assessed species

#### 6.2.1 Health and Structure

Eucalyptus globulus

Eucalyptus radiata

Other species

**TOTAL** 

The vast majority of the assessed trees exhibit 'Fair' to 'Good' health and structure. Despite this, six dead trees were recorded, and 47 trees were recorded with 'Poor' or 'Very Poor' structure. These dead trees and trees with 'Poor' or 'Very Poor' structure ratings have been assigned 'High' retention value due to their potential ecological significance.

Narrow-leaved Peppermint

From an arboricultural perspective, trees with hollows and cracks in their trunks and/or canopies are considered to have poor structure and ordinarily would not be considered to have high retention value. However, while these defects are good indicators of structural weaknesses, they are often ideal habitat for local fauna (Coulter, 2001). As such, trees identified as having potential habitat value were given 'High' retention value, regardless of their health or structure ratings.

Where applicable, the potential habitat value or ecological significance of a tree has been noted in the individual tree data (see Appendix 5).

18

16

42

715

### 6.2.2 Useful Life Expectancy (ULE)

As the focus of this report is on trees worthy of retention in the proposed landscape, the majority (84%) of the trees assessed have a Useful Life Expectancy (ULE) of greater than 20 years.

ULE approximates how long a tree can be retained safely and usefully in the landscape. ULE is determined based on assessments of health and structure as well as the current or projected life expectancy. In most cases, younger healthy trees will be anticipated to remain safely in the landscape for longer than mature, structurally unsound trees.

As with the health and structure ratings, a number of trees within the 'High' or 'Very High' retention value category have shorter ULEs but are worthy of retention in the landscape due to their potential landscape, cultural, ecological or habitat significance.

### 6.3 Potentially High Retention Value Trees

53 trees have been identified either from a distance, and/or through desktop analysis of aerial imagery, as potentially being 'High' retention value trees. These trees are located on land parcels that could not be accessed as consent had not been obtained to enter the property. As such a VTA could not be conducted on the trees to obtain accurate or reliable data.

The following table lists the property address and land parcel number where these potential 'High' retention value trees are located, along with the total number of candidate trees identified on each property.

Land Parcel Number	Property Address	No of Potential High retention Trees
10	200 Officer South Rd	7
13	Handford Lane	22
14	Handford Lane	2
32	330 Officer South Rd	5
35	360 Officer South Rd	6
39	410 Officer South Rd	11
	TOTAL	53

Table 6: Potential 'High' retention value trees by land parcel

#### 6.4 Medium and Low Retention Value Trees

'Medium' retention value trees are generally trees in 'Good' or 'Fair' health with a structural fault that may require arboricultural input or medium and small trees well established and in good condition. Where practical, design modifications should be considered to retain and protect these trees from construction impact.

'Low' retention value trees are generally trees with 'Poor' health and/or structure, self-sown, weed species or small/young trees that can easily be replaced in the landscape. Designing around these trees is considered unnecessary.

Throughout the assessment area, 237 groups of trees were recorded (Figure 4). These groups contain a mixture of 'Medium' and 'Low' retention value trees. The smallest number of individuals in a recorded group was 2, and the largest group contained 427 individuals.

In total, 5,722 'Low' retention value trees and 3,993 'Medium' retention value trees were counted across all the groups. Throughout the groups, 5,916 of the trees were native species and 3,799 were exotic.

Figure 4: Groups containing 'Medium' and 'Low' retention value trees indicated in purple

### 7. Introduction to Tree Protection Zone (TPZ)

The Tree Protection Zone (TPZ) is the principal means of protecting trees on development sites. It is a combination of the root area and crown area which is isolated from construction disturbance, so that the tree remains viable. The TPZ incorporates the Structural Root Zone (SRZ), the area around the base of a tree required for the tree's stability in the ground; the woody root growth and soil cohesion in this area are necessary to hold the tree upright. Further description of the TPZ and SRZ, and methods used for their calculation can be seen in Appendix 2.

Construction Impact is determined based on the level of encroachment into the TPZ of a tree as specified in the Australian Standard AS4970-2009. If the proposed encroachment is less than 10% of the area of the TPZ and is outside the SRZ ('minor' encroachment), detailed root investigations should not be required. The area lost to this encroachment should be compensated for elsewhere and contiguous with the TPZ. Where the proposed encroachment is greater than 10% of the TPZ or inside the SRZ ('Major' encroachment), the project arborist must demonstrate how, or if, the tree will remain viable. No roots are to be severed within the SRZ.

Appendix 5 displays the assessment data for all trees, including retention values and the dimensions of the TPZs and SRZs.

### 7.1 Design Considerations

#### 7.1.1 Amenity Value

Beyond the customary assessment criteria used to determine tree retention values; amenity value should also be considered for future or proposed landscapes. Existing mature trees offer significant amenity benefits to urban landscapes through providing shade, moderating temperature, wind and rainfall. In addition, mature trees assist in giving newly developed or constructed landscapes an established feel and appearance.

#### 7.1.2 Retention Methods

Incorporating existing trees into final plans should be aided by the trees' isolated groupings. High value trees may be able to be readily retained within small parks, extended roadside / centre median reserves and public use corridors. Examples of successful retention of this nature can be seen in Figure 5. These reserves with established trees significantly increase the visual amenity of a new development.

Ideally, final landscaping of parks should include understorey plantings within the TPZ of all retained mature trees; plantings could include small trees, shrubs, sedges or grasses. Plantings of this nature carry multiple purposes; for example, increased flora and fauna diversity within an area is well known to benefit environmental health. Most importantly, within

Figure 5: Extended parkland with multiple established trees and pathways

an urban context pedestrian access within the TPZ is generally restricted as ground cover vegetation deters movement, reducing the target rating of the area below the canopy.

#### **Preliminary Tree Assessment**

Victorian Planning Authority Officer South

In addition, when planning roadways, it is desirable to allocate space for street tree plantings. Services are often located in positions that constrain tree planting. Consideration should be given to the width of reserves as well as the placement of new infrastructure, (e.g. lamp posts, pits etc) to maximise space for plantings.

#### 7.1.3 Changed Land Use

A new development can often change the occupancy of parts of the site and some trees that would be considered 'manageable' in the present landscape may be inappropriate in a changed landscape. Trees with obvious structural faults may present an unacceptable risk next to a busy entrance way or in a high-profile location frequented by pedestrians. If the land use around the tree changes (to higher frequency of pedestrians and vehicles) then the same tree may be considered to have a higher risk of harm potential. Works may be necessary to reduce the risk; the design may require altering or the tree removed.

Officer South

### 8. Ideal Work Flow

An ideal work flow for key stages of tree protection measures within the development process has been formulated. The following workflow will ensure that optimal protection is afforded to the trees, thereby promoting tree health and stability and allowing for long-term retention in the landscape.

- Preliminary assessment of trees by arborist
- ✓ TPZs specified for trees suitable for retention
- Prepare proposed design
- □ Construction Impact Assessment
- ☐ Modify / finalise proposed design
- ☐ Implement Tree Protection (TPZ) measures
- Demolition and construction

#### 9. Conclusion

Trees were assessed within the proposed Officer South Employment Precinct to inform the preparation of a Precinct Structure Plan (PSP).

10,430 trees were assessed.

- 715 trees were considered to be of either 'High' or 'Very High' retention value, these trees were subjected to a full VTA, photographed, and had their details recorded.
- 9,715 trees were counted and recorded as groups of varying sizes. These trees are all of
  either 'Medium' or 'Low' retention value and as such a VTA was not conducted and they
  were not photographed. Only the number of 'Medium' retention, 'Low' retention, Native,
  and Exotic trees within each group was recorded.

In addition to the 10,430 trees assessed, 53 trees which could not be adequately accessed were recorded as potentially having 'High' retention value.

The following table summarises the number of assessed trees by retention value.

Table 7: Summary of Retention value

Retention Category	No of Trees
Very High	16
High	699
Medium	3993
Low	5722
Total	10430

As many trees as possible assessed with 'Very High' and 'High' retention values should be incorporated into the design.

Officer South

#### 10. Recommendations

#### It is recommended that:

- 16 'Very High' retention value trees and 699 'High' retention value trees are retained and incorporated into final design plans.
- As many trees as possible of the 'Medium' retention value trees are incorporated into the design.
- Low retention value trees are not considered a constraint on the design process for this site
- A Construction Impact Assessment Plan and Tree Protection Management Plan are undertaken following finalisation of design plans. This will enable impact on trees intended for retention to be determined and provide case specific advice concerning impact mitigation.
- TPZs for trees to be retained are shown on all design plans.
- The design team is made fully aware of the location of the trees to be retained including all appropriate tree protection measures prior to beginning the design process, particularly Tree Protection Zone (TPZ) guidelines, dimensions and requirements.
- The proposed design has minimal impact to the canopy and root systems of retained trees does not encroach on the specified TPZ of any retained trees. If this cannot be achieved, any encroachment exceeding 10% of the TPZ area, and/or within the SRZ must be assessed by a qualified arborist who will demonstrate how (or if) the tree will remain viable.
- TPZ specifications and guidelines outlined in Section 7 and Appendix 3 should be followed to ensure that all retained trees are adequately protected prior to, during and following the proposed construction.
- Prior to the commencement of works, including demolition and the removal of existing trees, TPZ fencing is erected around all trees to be retained and inspected by a qualified arborist to ensure it is adequate.
- Where trees are to be retained, pruning may be required. All pruning should be carried
  out by a fully qualified arborist experienced in pruning mature trees. The minimum
  qualification should be:
  - ♦ A National Certificate in Horticulture (Arboriculture) AQF Level 4.
  - All pruning must conform to the Australian Standard Pruning of Amenity Trees (AS 4373-2007).

### **Appendix 1. Data Collection Definitions & Descriptors**

Tree assessments are based on the assessor's experience and opinion of the tree.

#### 1.1 Botanical name

The scientific name identifying the genus and species of the tree. Each species has only one scientific name.

#### 1.2 Common Name

The colloquial name for a tree species, usually in plain English. Common names for a species are often local or regional and each species can have multiple common names.

#### 1.3 Tree dimensions

Tree height and canopy width in metres (estimated unless stated otherwise).

#### 1.4 DBH

Diameter of the trunk at breast height (1.4m above ground level) measured using a diameter tape (unless otherwise specified). Used to calculate the Tree Protection Zone radius.

#### 1.5 Basal diameter

Diameter of the trunk above the root buttress, measured using a diameter tape (unless otherwise specified). Used to calculate the Structural Root Zone radius.

#### 1.6 Health

Category	Description
Very Good	The tree is demonstrating excellent or exceptional growth. The tree exhibits a full canopy of foliage and is free of pest and disease problems.
Good	The tree is demonstrating good or exceptional growth. The tree exhibits a full canopy of foliage, and has only minor pest or diseases problems.
Fair	The tree is in reasonable condition and growing well. The tree exhibits an adequate canopy of foliage. There may be some deadwood present in the crown. Some grazing by insects or possums may be evident.
Poor	The tree is not growing to its full capacity; extension growth of the laterals is minimal. The canopy may be thinning or sparse. Large amounts of deadwood may be evident throughout the crown. Significant pest and disease problems may be evident or there may be symptoms of stress indicating tree decline.
Very Poor	The tree appears to be in a state of decline. The tree is not growing to its full capacity. The canopy may be very thin and sparse. A significant volume of deadwood may be present in the canopy or pest and disease problems may be causing a severe decline in tree health.
Dead	The tree is dead.

### 1.7 Structure

Category	Description
Good	The tree has a well-defined and balanced crown. Branch unions appear to be sound, with no significant defects evident in the trunk or the branches. Major limbs are well defined. The tree is considered a good example of the species.
Fair	The tree has some minor problems in the structure of the crown. The crown may be slightly out of balance, and some branch unions may be exhibiting minor structural faults. If the tree has a single trunk, it may be on a slight lean or exhibiting minor defects.
Poor	The tree may have a poorly structured crown. The crown may be unbalanced or exhibit large gaps. Major limbs may not be well defined. Branches may be rubbing or crossing over. Branch unions may be poor or faulty at the point of attachment. The tree may have suffered root damage.
Very Poor	The tree has a poorly structured crown. The crown is unbalanced or exhibits large gaps with possibly large sections of deadwood. Major limbs may not be well defined. Branches may be rubbing or crossing over. Branch unions may be poor or faulty at the point of attachment. Branches may exhibit large cracks that are likely to fail in the future. The tree may have suffered major root damage.
Has Failed	A section of the tree has failed or is in imminent danger of failure and the tree is no longer a viable specimen.

### 1.8 Age Class

Category	Description
Mature	Tree has reached the expected size for the species at the site.
Semi-mature	Established tree that has not yet reach the expected size for the species at the site.
Young	Recently planted tree or juvenile self-sown tree (generally less than 5 years old).

### 1.9 Useful Life Expectancy (ULE)

Category	Description
40+ years	The tree is in excellent condition and under normal conditions and with appropriate management is expected to continue as a viable landscape component in excess of 40 years.
20-40 years	The tree is in good condition and under normal conditions and with appropriate management is expected to continue as a viable landscape component for 20-40 years.
10-20 years	The tree is in fair condition and under normal conditions and with appropriate management is expected to continue as a viable landscape component for 10-20 years.
5-10 years	The tree is in fair to poor condition or it is not a long lived species. Removal and replacement may be required within the next 10 years.
1-5 years	The tree is in poor condition due to advanced decline or structural defect. Removal and replacement may be required within the next 5 years.
0 years	The tree is dead, or is considered hazardous in the location. Removal may be required.

# 1.10 Tree Origin

Category	Description
Exotic	The species originates in a country other than Australia.
Australian Native	The species originates within Australia.
Indigenous	The species originates within the local environs.

### 1.11 Contribution to the Landscape

Category	Description
High	Generally a large tree which is a significant component of the local landscape and provides canopy cover to the site. May offer shade and other amenities such as screening. The tree may assist with erosion control, offer a windbreak or perform a vital function in the location (e.g.: Habitat, shade, flowers or fruit).
Medium	Generally a medium sized tree or group of small-medium trees which provide a moderate contribution to the local landscape and canopy cover. The tree may offer screening in the landscape or serve a particular function in the location.
Low	The tree offers little in the way of screening, amenity or canopy cover.
Negligible	The tree offers extremely little to nothing in the way of screening, amenity or canopy cover.

### 1.12 Tree Retention Value

Term	Description
Very High	A mature tree of exceptional quality in good condition. A prominent landscape feature with very high amenity value and/or a prominent remnant specimen or other significance (Aboriginal significance). This also includes Semi-mature or Mature rare species in fair to good condition  All efforts should be made to retain the tree and protect from construction impact.
High	Tree of high quality in good to fair condition, including Semi mature long lived species with high amenity rating and Juvenile rare species. Trees of moderate condition include specimens that offer exceptional amenity due to factors such as species, size or ecological value.  All efforts should be made to retain the tree and protect from construction impact.
Medium	Tree of moderate quality in fair condition and generally a modest landscape feature. These include all trees that don't fit in the High or Very High categories and are assessed to have fair/poor or lower rating for either health or structure. These trees have the potential to be a medium to long-term landscape component where managed appropriately.  Where practical, design modifications should be considered in order to retain and protect from construction impact.
Low	Either: Tree of low quality in poor condition and weeds that offer low, medium or high amenity value. These trees are unlikely to be a long or medium term landscape component. Or: Juvenile trees (not including rare species) of good or fair condition which are easily replaced in the landscape through planting of advanced stock.

### **Appendix 2.** Tree Protection Zones & Structural Root Zones

All parts of the tree may be damaged by development and damage to any one part of the tree will affect its functioning as a whole.

Root damage is the most common cause of damage to trees on development sites. Roots may be removed, wounded, crushed or torn during grading, excavation or trenching. Soil compaction from foot traffic and vehicle traffic results in loss of pore space within the soil which is essential for the exchange of gases between the soil and atmosphere and soil drainage.

Trunks of trees may be wounded mechanically during demolition and construction work. This not only predisposes a tree to potential decay but it also interferes with the transport of water, nutrients and sugars throughout the tree. Serious impacts may structurally weaken the tree.

The canopy of trees can be damaged through incorrect pruning techniques or mechanical injury by trucks, cranes, excavators etc. The removal of leaves reduces the level of photosynthesis and reduces the tree's capacity to function normally and to withstand stresses. Incorrect pruning and mechanical damage can produce wounds that are susceptible to infection by wood decay organisms.

For trees to be retained and their requirements met, procedures must be in place to protect trees at every stage of the development process. This should be taken into account at the earliest planning stage of any outdoor event or design of a development project where trees are involved.

#### 2.1 Tree Protection Zones

The most common method of protecting trees during construction is by setting up a Tree Protection Zone (TPZ). The TPZ is an area isolated from construction disturbance area, so that the tree remains viable. The TPZ has been calculated according to the Australian Standard (AS 4970-2009) for the subject trees. This method calculates the TPZ as 12 times the trunk diameter at 1.4m above ground level (DBH).

A TPZ should not be less than 2m nor greater than 15m, except where additional crown protection is required. The TPZ of palms, other monocots, cycads and tree ferns should not be less than 1m outside of the crown projection.

#### 2.2 Structural Root Zones

The Structural Root Zone (SRZ) is the minimum volume of roots required by the tree to remain stable in the ground. If the SRZ is breached the chances of windthrow are significantly increased. Windthrow is an event where the entire tree fails/falls over.

It is important to note that the SRZ is not related to tree health. It refers to the physical volume of roots required for the tree to remain stable in the ground (Figure 6). It is in no way related to the physiological requirements of the tree, but is the minimum volume of roots required for the tree to remain standing (Mattheck and Breloer 1994).

According to AS4970-2009 the SRZ of the trees has been calculated using the equation:

$$R_{srz} = (D \times 50)^{0.42} \times 0.64$$

Figure 6: The SRZ = minimum volume of roots required for tree stability. Image from Biddle 1998.

#### 2.3 TPZ and SRZ encroachment

It may be possible to encroach into or make variations to the standard TPZ. Encroachment includes (but is not limited to) excavation, compacted fill and machine trenching.

Table 8: Levels of TPZ encroachment as defined by AS4970-2009

Level of Encroachment	Description / Definition	Requirements
Minor	Encroachment of less than 10% of the TPZ and outside the SRZ is deemed to be minor encroachment.	Detailed root investigations should not be required but the encroachment must be compensated with an extension to the TPZ elsewhere (Figure 7).  Variations must be made by the project arborist considering other relevant factors including tree health, vigour, stability, species sensitivity and soil characteristics.
Major	Encroachment of more than 10% of the TPZ or into the Structural Root Zone (SRZ) is deemed to be major encroachment.	The project arborist must demonstrate that the trees would remain viable. This may require root investigation by non-destructive methods and consideration of relevant factors of tree health, vigour, stability, species sensitivity and soil characteristics.  The area lost to this encroachment should be compensated for elsewhere and contiguous with the TPZ.

Figure 7: Example of minor TPZ encroachment and compensatory offset (image from AS 4970-2009).

### **Appendix 3.** Tree Protection Measures

#### 3.1 Tree Protection Fencing

The TPZ acts as a physical barrier of protective fencing that is a minimum of 1.8m high. It is installed around retained trees prior to site establishment and retained intact until completion of the works (Figure 8). Once erected, protective fencing must not be removed or altered without approval by the project arborist. The TPZ fence should be secured to restrict access.

Figure 8: TPZ fencing is erected around retained trees prior to site works.

#### 3.2 Signs

Signs identifying the TPZ should be placed around the edge of the TPZ and be visible from within the development site (Figure 9).

Figure 9: Example of a TPZ warning sign clearly displayed on TPZ fencing.

Victorian Planning Authority Officer South

#### 3.3 Activities restricted within the TPZ

Activities restricted within the TPZ are included but are not limited to:

- machine excavation including trenching
- excavation for silt fencing
- cultivation
- storage
- preparation of chemicals, including preparation of cement products
- · parking of vehicles and plant
- refuelling
- dumping of waste
- · wash down and cleaning of equipment
- placement of fill
- lighting of fires
- soil level changes
- temporary or permanent installation of utilities and signs
- physical damage to the tree.

#### 3.4 TPZ Maintenance

The area within the TPZ should be mulched. The mulch must be maintained to a depth of 50-100 mm. Where the existing landscape within the TPZ is to remain unaltered (e.g. garden beds or turf) mulch may not be required.

Soil moisture levels should be regularly monitored by the project arborist. Temporary irrigation or watering may be required within the TPZ. An above-ground irrigation system should be installed and maintained by a competent individual.

All weeds should be removed by hand without soil disturbance or should be controlled with appropriate use of herbicide.

#### 3.5 Working within the TPZ

Some works and activities within the TPZ may be authorized by the determining authority. These must be supervised by the project arborist. Any additional encroachment that becomes necessary as the site works progress must be reviewed by the project arborist and be acceptable to the determining authority before being carried out.

Where TPZ fencing is impractical - e.g. if site access is required through the TPZ, other tree protection measures should be used, including trunk and branch protection and/or ground protection.

#### 3.6 Ground Protection

If temporary access for machinery is required within the TPZ ground protection measures will be required. The purpose of ground protection is to prevent root damage and soil compaction within the TPZ. Measures may include a permeable membrane such as geotextile fabric beneath a layer of mulch or crushed rock below rumble boards (Figure 10).

#### 3.7 Trunk and Branch Protection

Where trees cannot be isolated from vehicles or machinery by TPZ fencing, trunk and branch protection may be required to prevent mechanical damage. Protection may consist of padding surrounding the trunk or branch, held in place with batons strapped together, or similar (Figure 10). Boards are to be strapped to trees, not nailed or screwed.

Crown protection may also include pruning, tying-back of branches or other measures. If pruning is required, it must be undertaken as per the specifications of AS 4373-2007 *Pruning of Amenity Trees* and should be undertaken before the establishment of the TPZ.

Figure 10: Example of trunk, branch and ground protection (Source: AS 4970-2009).

#### 3.8 Scaffolding

Where scaffolding is required it should be erected outside the TPZ. Where it is essential for scaffolding to be erected within the TPZ, branch removal should be minimised. Ground below the scaffolding should be protected by boarding (e.g. scaffold board or plywood sheeting). Where access is required, a board walk or other surface material should be installed to minimize soil compaction. Boarding should be placed over a layer of mulch and impervious sheeting to prevent soil contamination. The boarding should be left in place until the scaffolding is removed

### Appendix 4. Design Considerations

To minimise impact from construction within the TPZ of retained trees, the following factors should be considered at the design stage.

#### 4.1 Compaction or Fill

One of the most common problems with construction is changes to the soil environment where roots are growing. Roots need nutrients in the soil, water, oxygen and other gases in the atmosphere for physiological processes required to survive. Nutrients in solution (water) are taken up by the roots from the soil, which is then transported to other areas of the tree.

Soil compaction or fill (>100mm depth above natural grade) can inhibit these processes and should be avoided within the TPZ of retained trees. Compacting 'squashes' the pores in the soil whilst fill creates a layer that inhibits or completely prevents water infiltration and gas exchange with the soil.

Compacting or filling the soil level is detrimental because it changes soil conditions dramatically, the trees root system does not have time to adapt and this can lead to a decline in tree health and even death. Continuous pedestrian traffic, cars, trucks and earth moving machinery can all cause soil compaction.

#### 4.2 Permeable Materials

Hard surfaces, including driveways and outdoor areas should be designed to be permeable (paving, decking, porous concrete etc) in the vicinity of trees. Permeable materials reduce runoff, allow for water to penetrate down to the soil and encourage exchange of air with the atmosphere, thereby maintaining a high soil oxygen level (Ferguson 2005). Figure 11 provides an example of porous paving using Eco-Trihex pavers, which may be applicable for paved areas.

Figure 11: Example of Eco-Trihex paving

#### 4.3 Landscaping

Soft and hard landscaping within Tree Protection Zones should be assessed by the project arborist at the design stage, and prior to the commencement of works. In general:

- There should be no grade changes within the TPZ of trees to be retained. If a level surface is required, no more than 100mm of fill (e.g. topsoil or crushed rock) should be used.
- There should be no soil preparation for landscaping (cultivation, replacement of existing substrate or compaction) within the TPZ of trees to be retained.

- Excavation for planting holes, fence posts, garden edging, etc. should be undertaken
  manually within the TPZ of trees to be retained. If large roots are encountered these are
  to be retained unscathed and the location of the landscape component shifted. Any small
  roots are to be cleanly pruned by the project arborist, at right angles, using sharp, clean
  tools.
- Paths should be constructed from a permeable or porous material within the TPZ of trees to be retained. Paths must be constructed at or above grade with minimal compaction of the material. There should be no compaction of the subgrade.

#### 4.4 Boardwalk

Creating a boardwalk underneath the canopies of trees reduces the impact as only post holes need to be dug (rather than large scale earth scraping and cutting to create a level path) minimising soil disturbance. Soil compaction from human and vehicular traffic is also eliminated.

It is important that the boardwalk sits a few centimeters above grade to avoid compaction of the soil. Planks should have a minimum of 3mm between to allow water to filter down to the soil and roots below. Figure 12 & Figure 13 provide a diagrammatic view of how the boardwalk should appear.

Figure 12: Approximate boardwalk design

Figure 13: Aerial view of boardwalk design.

#### 4.5 Underground services

Underground services within Tree Protection Zones should be assessed by the project arborist at the design stage, and prior to the commencement of works.

- All underground services (including water, electricity, gas and telephone) should be located outside of the TPZ of trees to be retained.
- If underground services are to be routed within an established TPZ, they should be installed by directional boring with the top of the bore to be a minimum depth of 600mm below the existing grade.
- Bore pits should be located outside of the TPZ or manually excavated under the direct supervision of the Project Arborist.

# **Appendix 5.** Tree Assessment Data Table

ID	Botanical Name	Origin	Height & Width (m)	DBH (cm)	Age Class	Health	Structure	ULE (years)	Retention Value	TPZ Radius (m)	SRZ Radius (m)	Property Address	Significance
1	Eucalyptus botryoides	Native	18 x 14	106	Mature	Good	Fair	20 - 40	High	12.72	3.44	185 Officer South Rd	None
2	Eucalyptus botryoides	Native	16 x 19	104	Mature	Good	Poor	10 - 20	High	12.48	3.51	185 Officer South Rd	None
