1. EXECUTIVE SUMMARY

The Victorian Planning Authority (VPA) in partnership with City of Greater Bendigo Council has contracted ENSPEC to prepare an Arboriculture Assessment for the proposed the Bendigo Regional Employment Precinct (BREP). The purpose of the assessment is to identify the retention values of trees to help the VPA determine which trees should be retained during the development of the precinct. The proposed Marong Western Freight Corridor is outside the scope of this report.

3228 individual trees and 29 groups were assessed, for a total of 4621 trees. Tree counts for groups with >10 individuals are approximate only.

78.7% of the trees recorded are naturally occurring specimens of locally indigenous species.

Each tree or group has been given a retention rating based on its species, origin, size, condition and location. A summary of the Retention rating for individual trees is provided in the following table.

Table 1

Retention	No. of trees	% of total
Critical	362	7.8%
High	2834	61.3%
Moderate	800	17.3%
Low	353	7.6%
None	272	5.9%
Grand Total	4621	100.0%

Critical and High Retention value trees within the project area are almost exclusively remnant indigenous trees, largely grouped along the existing roadsides and in two patches. 39 trees are isolated large paddock trees, of which 13 are rated Critical Retention value and 25 are rated as High Retention value.

Overall, outstanding biodiversity and landscape values are provided by the existing indigenous trees identified in the BREP. These trees and hence the greatest value is concentrated in the roadside vegetation along all of the existing roads. The roadside trees are of particularly high value as they contain a mix of age ranges and natural recruitment of new trees is occurring spontaneously. Two patches on private lots totalling ~4.5ha are also of Critical retention value.

Photo 1 – O’Sullivan’s Road

Photo 2 – Cemetery Road

The BREP is intended to be a large scale industrial / employment area.

Industrial activity is usually highly limiting for vegetation and tree cover, with the need for wide access roads, large buildings and hardstand areas making the available open ground needed for trees and vegetation very limited.

Preservation of the existing landscape and biodiversity values provided by the current tree population will require thoughtful planning and a willingness to invest adequate space in their preservation.

The existing secondary roads, O’Sullivan’s Road and Cemetery Road, will not support the industrial traffic that will result from the development of the BREP. Upgrading these roads will not be viable as there are

many large trees within the road reserve that would prevent upgrading them to an adequate standard for industrial access.

The Council website in relation to the BREP states –

The City is aware of the importance of retaining existing vegetation to the Marong and broader community and this is a key consideration in planning for the future precinct.

Consistent with Council's stated goal of retaining existing vegetation, it is strongly recommended that the two existing unmade roads be downgraded to local access no through roads as part of the development, with an alternative access road network developed within the existing cleared land. A well-designed network could provide for the preservation of the current roadsides as linear conservation reserves, potentially including low impact walking or cycling use, connected by habitat corridors established along the new road and drainage networks, linking the preserved roadside and patches with the currently contiguous Wilson Hill Bushland Reserve and highway roadsides. These opportunities need to be assessed as part of the transport assessment and incorporated into the overall plan for the precinct.

The grouping of the high value trees allows for the possibility of excellent levels of tree preservation and protection by incorporating the existing patches and roadsides into a linked reserve network, potentially enhanced by the incorporation of any drainage reserves that may be required for the development of the area.

The key recommendations for preserving the higher Retention value existing trees and broader ecological and landscape values they provide within the BREP are -

- In order to preserve the existing high roadside biodiversity value, downgrade O'Sullivan's Road and Cemetery Road to local access no through roads, ensuring they cannot be used as short cuts or access for traffic accessing or avoiding the industrial precinct. Redevelop these roads to enhance low impact activity such as walking and cycling.
- Develop an alternative access road network within the currently cleared land using access and crossing points that maintain biodiversity linkages and minimise impacts to existing high value trees along the existing roadsides.
- Preserve within reserves ~4.5ha in two existing high value patches of remnant trees, one at Property 8 and the other on Property 11.
- Use the new access road network and any open drainage network to enhance habitat linkages between the preserved patches, roadsides and the currently contiguous Wilson Hill Bushland Reserve, as well as existing corridors along the Wimmera Highway and Calder Alternative Highway.
- Ensure preserved trees have adequate space for their continued function without conflicting with the use of adjacent land.
- Design any future highway upgrades to maintain existing water run-off patterns to the roadsides as the existing trees are adapted to this water availability.
- For any isolated trees retained design the sites such that adequate space to ensure their Tree Protection Zones are appropriately protected as stipulated by AS4970-2009 *Protection of trees on development sites*.
- Show trees to be retained and their Tree Protection Zones on all planning and design documentation to ensure adequate planning for their preservation and protection.
- Require strict adherence to AS4970 for trees to be retained and ensure this is requirement included in all documentation.

2. INTRODUCTION

The VPA in partnership with City of Greater Bendigo has contracted ENSPEC to prepare an Arboriculture Assessment for the proposed the Bendigo Regional Employment Precinct (BREP). The purpose of the assessment is to identify the retention values of trees to help the VPA determine which trees should be retained during the development of the precinct.

An extract on the purpose of the BREP from the Council website -

The Bendigo Regional Employment Precinct will provide much-needed industrial land for new and existing businesses looking to expand or relocate to Greater Bendigo.

The need for a new employment precinct is significant as there is currently less than 100 hectares of available serviced industrial land in Greater Bendigo. That means less than 10 years' land supply is left, which impacts our ability to attract and retain businesses. This new employment precinct is needed to meet Greater Bendigo's long-term industry needs.

Bendigo Manufacturing Group has been advocating Council and government for many years now about the need for large, unconstrained parcels of industrial land to facilitate business investment and development in the region.

3. BRIEF & INSPECTION METHODOLOGY

3.a. Scope

The VPA in partnership with City of Greater Bendigo requires a suitably qualified contractor to prepare an Arboriculture Assessment. The purpose of the assessment is to identify the retention values of trees to help the VPA determine which trees should be retained during the development of the precinct.

The scope of the assessment is to determine the health, type, and integrity of the trees within the precinct. The assessment will also determine their arboriculture value, landscape value and their likelihood of survival in an urban environment.

Parcels and roadsides within the precinct (as well as roadsides adjacent to but outside the precincts) that have not previously been assessed will be required to be surveyed. If access is not possible then a visual assessment from the property boundary must be undertaken to obtain a basic understanding of the value of any visible trees.

The Bendigo Regional Employment Precinct (BREP) is a significant project for the City of Greater Bendigo (Council) and presents a unique opportunity to lead the delivery of a new, large scale, leading edge industrial / employment precinct.

The Precinct is approximately 294ha of existing Farming Zone land made up of 13 titles. 6 titles are owned by the City of Greater Bendigo (155ha).

The area is a gently undulating landscape within scattered trees and extensive roadside vegetation. The land slopes to the north and west with a high point through the centre of the site.

The area is located within the Goldfields and Victorian Riverina bioregions.

Figure 1- BREP Investigation Area

The ultimate land use response for the precinct is yet to be determined as there are many factors that must be considered. Two of the most notable being the proposed Marong Western Freight Corridor that transverses the site (as reflected in the Adopted Marong Township Structure Plan) and the Marong Township Structure Plan that will guide future growth of the adjoining town and provides the framework for identification of the precinct.

The Marong Western Freight Corridor is outside the scope of this report.

3.b. Methodology

Site methodology involved a visual inspection each tree's present health and growing environment and recording of data electronically in the field. Groups of lower value trees, windrows or hedges were collected as groups. Higher value trees within groups are recorded individually.

Where accessible, the trunk diameter at breast height (DBH) and basal diameter for individually recorded were measured using a forestry tape measure for the calculation of the Tree Protection and Structural Root Zones in accordance with AS4970-2009 *Protection of trees on development sites*. To comply with native vegetation requirements, the DBH of each tree was measured at 1.3m above ground. This measurement is used for AS4970 calculations and is considered to make no material difference to the effectiveness of AS4970 zones. Other dimensions were visually estimated.

Individual trees were tagged with numbered aluminium tags where accessible. These tag numbers are used to refer to individual trees within this report.

Access to most of Lot 6 O'Sullivan's Road was not available for biosecurity reasons. As far as practical, the number and type of trees was assessed remotely from adjoining land.

4. DATES OF ASSESSMENT

The trees were assessed between February 28th and March 14th, 2023. Supplementary assessment of trees on the road reserves of the roads bounding the study area was undertaken on August 8th and 15th, 2023

6. OVERVIEW AND CONTEXT

6.a. Relevant policy and legislation

The land in the study area is currently zoned Farm Zone (FZ) and no environmental or heritage overlays apply to any of the land.

None of the naturally occurring tree species recorded are listed on the State Threatened Species Lists. *Eucalyptus leucoxylon* subsp. *megalocarpa* (7 trees) & *Eucalyptus sideroxylon* (44 trees) are on the Lists but the specimens identified have been planted so the provenance of these is unknown. These are commonly planted ornamental species, so they are considered highly likely to be ornamental selections and not of local provenance.

Clause 52.17 of the Planning Scheme relating to the removal of native vegetation will apply to the project area.

Heritage Overlay site HO687 is adjacent to the Precinct (Properties 16, 23 & 24). Tree controls do not apply to this listing.

The Victorian Heritage Inventory includes the Cemetery Road Gold Mining Landscape (H7724-0644) which encompasses two discontinuous areas of land spanning several agricultural properties located north of Cemetery Road and west of the Wimmera Highway. This covers part of the Precinct north of Cemetery Road but no map of the areas is available for this report.

6.b. Overview

An overview of the trees assessed is provided in the following map. An A3 version and detail maps are provided in the appendices.

Figure 2 - Project overview

7. TREE POPULATION SUMMARY

A summary of the general tree data for the surveyed population is provided in the following section. For groups, factors such as life expectancy have been rated as a typical rating for individuals within the group although there will be variation within a given group.

Access to most of Lot 6 O'Sullivan's Road was not available for biosecurity reasons. As far as practical, the number and type of trees was assessed remotely from adjoining land.

7.a. Species

3228 individual trees and 29 groups were assessed, for a total of 4621 trees. Tree counts for groups with >10 individuals are approximate only.

Table 2

Species	Common name	No. of trees	% of total
<i>Acacia baileyana</i>	Cootamundra Wattle	2	0.04%
<i>Acacia dealbata</i> *	Silver Wattle	2	0.04%
<i>Acacia decurrens</i>	Queen Wattle	6	0.13%

* indigenous or likely indigenous species

7.b. Life expectancy

An estimate of the life expectancy for each tree was made based on the tree's current health, condition, and growing environment. Any significant change in these factors in the future will affect the life expectancy of the tree.

A summary of the life expectancy of the trees on the site is provided in the following table.

Table 3

Life expectancy	No. of trees	% of total
50 plus years	4118	89.1%
30 - 49 years	129	2.8%
10 - 29 years	186	4.0%
Less than 10 years	39	0.8%
Dead	149	3.2%
Grand Total	4621	100.0%

7.c. Life stage

The life stage of each tree was assessed and is expressed as described in the following descriptions. Life stage is based on species characteristics and the rate at which the individual tree is growing in its local environment. As such, Life Stage can be quite independent of the chronological age of the tree.

Table 4

Life stage	Description
New	- Planting hardware present and under maintenance (watered) - Self-seeded sapling
Established	- Planting hardware absent/unmaintained - Not being watered - Susceptible to casual vandalism
Young	- Established - Rapid vertical growth phase - Too big to be damaged by casual vandalism
Mature	- Vertical growth slowed - Canopy spreading or stable
Aged	- Older specimen - Self-retrenchment may have started - Likely to have habitat hollows - Large dead or broken branches may be present in upper canopy
Veteran	- Very old specimen for the species in the local area - Usually has started to shed limbs with age, develop hollows - High value habitat - Generally, requires target management in well used areas - Not suitable for short-lived species e.g. most <i>Acacia</i> spp., <i>Hakea</i> spp.

Senescent	• Old tree in terminal decline • Majority of canopy is dead wood • A stag with limited canopy
-----------	---

A summary of the life stage of the trees on the site is provided in the following table.

Table 5

Life stage	No. of trees	% of total
Established	284	6.1%
Young	958	20.7%
Mature	3313	71.7%
Aged	46	1.0%
Veteran	7	0.2%
Senescent	13	0.3%
Grand Total	4621	100.0%

7.d. Health / Canopy condition

The health of the tree was assessed based on visual factors including foliage colour, canopy density, shoot extension growth, the presence of deadwood and dieback.

A summary of the health of the trees on the site is provided in the following table.

Table 6

Health	No. of trees	% of total
Healthy	3978	86.1%
Sparse	199	4.3%
Dieback	141	3.1%
Minor decline	46	1.0%
Medium decline	67	1.4%
Severe decline	41	0.9%
Dead	149	3.2%
Grand Total	4621	100.0%

7.e. Structure

An overall assessment of the mechanical structure of the tree was made based on observable factors including tree form, branch attachment and taper, wood decay and cavities, previous pruning, and any damage the tree has suffered. A tree with factors that fall within the expected range for the species and size, and that do not significantly increase the risk posed by the tree, will be rated as Typical.

A summary of the structure of the trees on the site is provided in the following table.

Table 7

Structure	No. of trees	% of total
Typical	3341	72.3%
Fair	1134	24.5%
Poor	108	2.3%
Very poor	19	0.4%
Hazardous	13	0.3%
Failed	6	0.1%
Grand Total	4621	100.0%

7.f. Origin

The likely origin of the tree has been evaluated based on species, location and context.

Origin	Description
Indigenous	Locally indigenous species that is self-seeded from nearby remnant vegetation or revegetated areas.
Native planted	Australian native species that has been purposefully planted. This may include planted examples of locally indigenous species.
Exotic	Species from outside Australia. This may include weed species.
Weed	Environmental or declared weed species

A summary of the likely origin of the trees is provided in the following table.

Table 8

Origin	No. of trees	% of total
Indigenous	3637	78.7%
Native (planted)	702	15.2%
Exotic	59	1.3%
Weed	223	4.8%
Grand Total	4621	100.0%

7.g. Ecological features

Notable ecological tree features were noted when observed. This is not a comprehensive ecological study.

Table 9

Ecology	No. of trees	% of total
Bark plates	3	0.8%
Bird(s) resident	35	9.2%
Habitat cracks	50	13.1%
Habitat hollows	289	75.9%
other	4	1.0%
Grand Total	381	100.0%

7.h. Retention value

Each tree has been given a retention rating. The ratings and general descriptions are provided in the following table. When applying a Retention rating within the same species some relativity is applied taking into account size and condition to assist in prioritising preservation. Individual Retention ratings for each tree or group are provided in the accompanying data tables.

Table 10

Retention Rating	Description
Critical	Protected/significant/specimen tree/patch in good condition
High	Mature/rare/indigenous/habitat/landscape specimen tree/patch in good condition
Moderate	Mid-sized tree, other landscape specimens
Low	Small / miscellaneous planted trees in good condition
None	Small, dead, poor condition or weed species

A summary of the Retention rating for individual trees is provided in the following table. Many of the trees occur in rows or groups where the overall Retention rating of the group may be higher or lower than the individuals within the group.

Table 11

Retention	No. of trees	% of total
Critical	362	7.8%
High	2834	61.3%
Moderate	800	17.3%
Low	353	7.6%
None	272	5.9%
Grand Total	4621	100.0%

The Retention values are shown on maps in the appendices.

7.i. Summary by address

A summary of tree occurrence is provided in the following table. Access to one property could not be arranged. For this property, as far as practical, the number and type of trees was assessed remotely from adjoining land. While some properties could not be accessed it is expected that the majority of trees have been accounted for in the assessment.

Table 12

Address	Property number	No. of trees	% of total
1877 Calder Alternative Highway	2	165	3.6%
211 Bendigo-St Arnaud Road	3	35	0.8%
41 O'Sullivan's Road	1	84	1.8%
7C Bendigo-St Arnaud Road	4	74	1.6%
Lot 8 Bendigo-St Arnaud Road	7	5	0.1%
Lot 1 Calder Alternative Highway	8	172	3.7%

8. DISCUSSION

8.a. AS4970-2009 *Protection of trees on development sites*

Where access was available to measure individual trees, the Tree Protection Zone and Structural Root Zone for each of the trees has been calculated in accordance with AS4970-2009 *Protection of trees on development sites*. The radius of the nominal zones in metres is provided in the tree data.

Australian Standard 4970 provides formulae for the calculation of Tree Protection and Structural Root Zones. These are the critical spaces required to prevent catastrophic damage leading to immediate failure, and to provide adequate soil volume for the long-term viability of existing trees. Effective protection of the TPZ is required if retained trees are to be effectively preserved.

Robust fencing or barriers must be in place to protect the TPZ of preserved trees for the duration of any works in their vicinity. The TPZ must not be used for any activity during any works, including but not limited to –

- Vehicle and machinery access or parking
- Materials handling or storage
- Dumping or storage of spoil

Encroachment of the TPZ can often be achieved with due care, planning and appropriate construction techniques. A Project Arborist is required in these cases to determine appropriate methods and controls to ensure the health and integrity of the tree.

The Project Arborist must be a consulting arborist that holds a Diploma in Arboriculture (AQF Level 5) and has extensive experience in building and development projects.

8.b. The value of the trees to the landscape

Outstanding biodiversity and landscape values are provided by the indigenous trees within the study area. These trees and hence the value is concentrated in the roadside vegetation and a few patches, which exists on all of the roads assessed.

Photo 3 – O'Sullivan's Road

Photo 4 – Wimmera Hwy

Notwithstanding the value of the larger patches of trees, there are some outstanding isolated paddock trees that are of high retention value and strongly complement the landscape.

8.c. Key biodiversity issues and implications

8.c.1 Isolated paddock trees

There are isolated paddock trees with high and critical retention value. These trees are at high risk from development.

Urbanisation will significantly increase the pressure on these high value trees, if they are retained, by increasing their isolation from nearby stands of trees, decreasing the ability of birds and animals to migrate to them. This can increase biological pressure, such as insect attack. Further, there is a tendency to minimise the space available to individual preserved trees, often reducing the available soil space and water infiltration area to such small amounts as they become unviable.

These trees are also older trees that may be or will become more likely to develop dead wood, decay and shed branches, increasing the perception and/or reality of risk to users of urban spaces around them.

Successful preservation of large, isolated trees requires sufficient ground space to accommodate all of these factors that threaten the preserved tree.

Photo 5 – Isolated trees

Photo 6 - Patch 1

8.c.2 High habitat value patches

There are two very high ecological value patches on the private land, totalling ~4.5ha.

The first patch of ~1.8ha at Lot 1 Calder Alternative Hwy (Property number 8) contains a mix of mature indigenous species with high habitat value, including a Wedge-tailed eagle (*Aquila audax*) nest (Photo 8).

Photo 7 – Patch 1 at Lot 1 Calder Alternative Hwy (Property 8)

Photo 8 - Nest (Tag 373)

The second patch of ~2.7ha is on the south boundary along Cemetery Road at Property number 11 (Figure 3).

Figure 3 - Patch 2 at Cemetery Road (Property 11)

8.c.3 Roadsides on O'Sullivan's and Cemetery Roads

The roadside vegetation has very high ecological value, with a range of ages (Photo 9), including aged trees with active habitat. Natural recruitment of new seedlings is occurring along these roadsides (Photo 10).

Photo 9 - Mixed age stands

Photo 10 – Roadside regeneration

It is recommended that the functional design of any new development preserves these high value areas. The existing unmade roads (O'Sullivan's Road and Cemetery Road) will be inadequate to support the increased traffic loads brought by urbanisation.

Further, the proximity of large and high value trees so close to the existing road surface (Photo 11 & 12) is likely to preclude the construction and sealing of these roads at a standard to support higher traffic volumes or industrial traffic.

These roads should be downgraded to local access no through roads as part of the development, with an alternative access road network developed within the existing cleared land. The current road reserves should be retained as linear conservation reserves, potentially incorporating walking or cycling paths.

Planning and design must ensure they are not used by industrial traffic as short cuts or "rat runs", or by light vehicle traffic to avoid congestion and heavy vehicles around the industrial precinct. The opportunity for pedestrian and cycling use, as well as enhancing their function as biodiversity corridors should remain primary goals for these roads.

The opportunities to retain existing roadside vegetation and increase low impact amenity access should be explored during the transport assessment for the precinct.

Photo 11 – Large trees close to the road

Photo 12 – Large trees close to the road

Access points for a future road network that minimise the impact on existing trees is shown in Figure 4. The future road network should provide good access while allowing for the retention of the high value existing roadside and vegetation patches in reserves. Recommended locations for the road network to intersect with O'Sullivan's Road are also shown that will minimise tree loss by using existing gaps in the population. As discussed above it is recommended that access from the Wimmera Hwy or Cemetery Road to O'Sullivan's Road will not be maintained and that it will not form part of the road network for the project.

Figure 4 – Recommended road access and intersection points with existing roads

8.d. Implications of urban development on the health and structural condition of trees

The BREP is intended to be a large scale industrial / employment area.

Industrial activity is usually highly limiting for vegetation and tree cover. A nearby example at Kangaroo Flat can be seen in Figure 5. What Figure 5 also shows is the importance of vegetation corridors, particularly roadside areas, to the effectiveness of vegetation retention in industrial zones. This emphasises the importance of the preservation of the roadside of the currently unmade roads in the project area (O'Sullivan's & Cemetery Roads).

Figure 5 - Industrial Zone (IN1 & IN3) at Kangaroo Flat

The other interesting point to note is the size of the industrial access road in this area. Clearly construction of a road network of this scale is unviable within the existing road reserves of O'Sullivan's & Cemetery Roads. The importance of downgrading these roads to local access no through roads and retaining them as linear conservation corridors is therefore critical to avoiding native vegetation loss and maximising biodiversity retention.

A well-designed road network would also allow for the existing high value vegetation patches to be retained with supporting habitat corridors to the existing roadside vegetation and nearby Wilson Hill Bushland Reserve. The use of drainage corridors, water treatment wetlands and retarding basins to further enhance habitat corridors should be investigated.

Ongoing threats to retained trees include –

- Land clearing and grading,
- Civil construction,
- Increased pavement and buildings decreasing water permeability into the soil,
- Community expectations of urban development.

To protect retained trees, particularly in patches and isolated trees, adequate space must be provided for them so that these threats do not lead to subsequent tree loss once the development proceeds, and new land use pressures start to be applied.

For any trees retained it will be essential to design the sites and provide adequate space to ensure their Structural Root Zones and 90% of their Tree Protection Zones are adequately protected as stipulated by AS4970-2009 *Protection of trees on development sites*.

Reduction of available soil water can be a critical factor in detrimentally affecting the health of preserved trees. Designing the landscape to ensure adequate permeability of water into the soil, including maintaining soil levels, drainage and surface permeability, is a major component of ensuring effective tree preservation and achieving tree canopy covers goals will be achieved.

8.e. Maintaining and increasing tree canopy coverage

There are existing large trees that are performing well in this location. These species are obvious candidate species for future planting to increase canopy cover; however, their performance will be dependent on maintaining good suitable conditions. Common urban development practices such as removal of topsoil, changing of hydrology, increased impermeable surfaces and reduced run-off are all important factors that will detrimentally affect a tree's capacity to perform in the landscape.

Species that should be considered are presented in the following table.

Species	Common name	Type	Origin
<i>Corymbia maculata</i>	Spotted Gum	Evergreen	Native
<i>Eucalyptus albens</i>	White Box	Evergreen	Indigenous
<i>Eucalyptus camaldulensis</i>	River Red Gum	Evergreen	Indigenous
<i>Eucalyptus leucoxylon</i> ssp. <i>pruinosa</i>	Inland Blue Gum	Evergreen	Indigenous
<i>Eucalyptus melliodora</i>	Yellow Box	Evergreen	Indigenous
<i>Eucalyptus microcarpa</i>	Grey Box	Evergreen	Indigenous
<i>Ginkgo biloba</i>	Ginkgo	Deciduous	Exotic
<i>Jacaranda mimosifolia</i>	Jacaranda	Deciduous	Exotic
<i>Melia azedarach</i>	White Cedar	Deciduous	Native
<i>Quercus palustris</i>	Pin Oak	Deciduous	Exotic
<i>Quercus robur</i>	English Oak	Deciduous	Exotic
<i>Quercus rubra</i>	Red Oak	Deciduous	Exotic

This list is not exhaustive and other species may be suitable depending on available space and the growing environment. All of these recommended species will provide significant amenity value; however, the indigenous species will provide far greater habitat and connectivity benefit within and through the precinct. The indigenous species should be prioritised for planting wherever practical as part of maintaining and enhancing the biodiversity and connectivity.

8.f. Road design and future upgrades

The existing main roads around the precinct, the Calder Alternate Highway and the Wimmera Highway, are both dual carriageway sealed roads with gravel shoulders. These road profiles are typically beneficial for existing roadside trees as they shed water onto the roadside where it can soak into the soil making it available to the trees. A major concern during rural road upgrades is the introduction of drainage, swales or kerbs that prevent run-off or redirect water from the road surface away from established trees. Reduction in available soil water is a major factor in the degradation of health for trees in these situations. Any proposed upgrades to these roads need to take this into account and the design needs to maintain existing water run-off patterns and soakage areas.

Photo 13 - Road cross-section, Wimmera Hwy

Common minor road upgrades such as shoulder sealing and safety barriers can typically be undertaken without serious detriment to most existing trees; however, arboricultural input into any upgrade design is required to ensure that the potential impacts on the trees are assessed and minimised.

Major road upgrades such as pavement widening, full depth shoulder reconstruction, overtaking lanes, turning lanes and the like will impact on trees in the vicinity and must be designed to minimise tree impact and loss.

8.g. Risk associated with retained trees

Large old trees inevitably develop factors such as dead branches and decay that can lead to the shedding of large pieces. In a low use rural setting these trees present a miniscule risk to the community. As usage increases around such trees, the risk also increases. Obvious remedial works have been specified for certain trees that were assessed assuming that the development proceeds. Further risk assessment will be required over the life of any retained trees, particularly if they are adversely affected by the development or are given inadequate space and separation from increased usage areas such as roads.

In most cases, the more significant issue with old, retained trees in new developments is the perception of the risk they pose, based on the layperson's interpretation of factors in old trees. The best way to manage this is to plan for adequate space around these trees such that there is separation between the tree and regular human activity.

9. REMEDIAL WORK

Remedial maintenance recommendations have been provided for specific trees based on their retention and incorporation into development. These works are not necessary while the trees are part of the existing rural landscape. Please see the accompanying data tables for work recommendations.

9.a. Pruning

Any pruning work must be carried out by appropriately qualified arborists working to AS4373-2007 *Pruning of amenity trees*, Minimum Industry Standard *MIS308 Tree pruning* and Minimum Industry Standard *MIS312 Environmental arboriculture*.

10. CONCLUSION

The proposed Bendigo Regional Employment Precinct (BREP) is currently a farming area with many high conservation value trees, primarily along the roadside and in patches. The proposed development would see this become an industrial area.

The grouping of the high value trees allows for the possibility of excellent levels of tree preservation and protection by incorporating the existing patches and roadsides into a linked reserve network, potentially enhanced by the incorporation of any drainage reserves that may be required for the development of the area.

Key to a positive outcome in preserving the existing trees is keeping increased traffic volumes off the existing unmade roads, O'Sullivan's and Cemetery Roads, by downgrading them to local access no through roads, and the development of a new road network to service the proposed industrial precinct.

11. RECOMMENDATIONS

The key recommendations for preserving the higher Retention value existing trees within the BREP are -

- In order to preserve the existing high roadside biodiversity value, downgrade O'Sullivan's Road and Cemetery Road to local access no through roads, ensuring they cannot be used as short cuts or access for traffic accessing or avoiding the industrial precinct. Redevelop these roads to enhance low impact activity such as walking and cycling.
- Develop an alternative access road network within the currently cleared land using access and crossing points that maintain biodiversity linkages and minimise impacts to existing high value trees along the existing roadsides.
- Preserve ~4.5ha in two existing high value patches of remnant trees, one at Property 8 and the other on Property 11.
- Use the new access road network and any open drainage network to enhance habitat linkages between the preserved patches, roadsides and the currently contiguous Wilson Hill Bushland Reserve, as well as existing corridors along the Wimmera Highway and Calder Alternative Highway.
- Ensure preserved trees have adequate space for their continued function without conflicting with the use of adjacent land.
- Design any future highway upgrades to maintain existing water run-off patterns to the roadsides as the existing trees are adapted to this water availability.
- For any isolated trees retained design the sites such that adequate space to ensure their Tree Protection Zones are appropriately protected as stipulated by AS4970-2009 *Protection of trees on development sites*.
- Show trees to be retained and their Tree Protection Zones on all planning and design documentation to ensure adequate planning for their preservation and protection.
- Require strict adherence to AS4970 for trees to be retained and ensure this is requirement included in all documentation.

13. DISCLOSURE STATEMENT

ENSPEC Pty Ltd and their employees are specialists who use their knowledge, training and education (qualifications), infield learning experiences, personal experiences research, diagnostic tools, scientific equipment to examine trees, recommend measures to enhance the beauty, health and preservation of trees, to reduce the risk of living near trees.

Trees are living organisms that can be affected by pests, diseases, and natural events outside of ENSPEC control. ENSPEC and their employees cannot detect every condition that affects a trees health, condition, and structural integrity. Conditions are often hidden within trees and below ground where humans cannot naturally see. Unless otherwise stated, ENSPEC's employee's observations have been visually made from ground level.

In the event that ENSPEC recommends retesting or inspection of trees at stated intervals, or ENSPEC recommends the installation engineering solutions, ENSPEC must inspect the engineering solution at intervals of not greater than 12 months, unless otherwise specified in writing. It is the client's responsibility to make arrangements with ENSPEC to conduct re-inspections.

Intervention treatments of trees may involve considerations beyond the scope of ENSPEC's service, such as property boundaries and ownership, disputes between neighbours, sight lines, landlord-tenant matters, and other related incidents. ENSPEC cannot take such issues into account unless complete and accurate information is given prior or at the time of the site inspection. Likewise, ENSPEC Pty Ltd cannot accept responsibility for the authorisation or non-authorisation of any recommended treatment or remedial measures undertaken.

ENSPEC Pty Ltd cannot guarantee that a tree will be healthy or safe under all circumstances or for a specified period of time after our initial inspection and recommendations.

If this written report is to be used in a court of law, or any other legal situation, or by other parties ENSPEC must be advised in writing prior to the written report being presented in any form to any other party. All written reports must be read in their entirety. At no time shall part of the written assessment be referred to unless taken in full context with the whole written report.

Clients may choose to accept or disregard the recommendations of the assessment and written report.

Notwithstanding anything in the report, express or implied, the client is not entitled to recover from ENSPEC Pty Ltd, its employees, agents and/or subcontractors any damages for business interruption or loss of actual or anticipated revenue, income or profits or any consequential, special, contingent or penal damage, whatsoever, and the client releases ENSPEC Pty Ltd from any such liability. Without limitation of the foregoing, a party shall at all times be limited (to the extent permitted by law) damages in the amount paid by the Client to ENSPEC Pty Ltd for ENSPEC Pty Ltd services. The limitation applies whether the claim is based on warranty, contract, statute, tort (including negligence) or otherwise.

16.j. Property 22 – Wilson Bushland Reserve

A few trees on the edge of the reserve were included where they were close to the assessment area. This is not a complete survey of the reserve.
