1 Introduction

1.1 Background

The Metropolitan Planning Authority (MPA) engaged Cardno Victoria Pty Ltd to undertake traffic modelling for the Leneva-Baranduda Growth Area in Wodonga to inform the development of the Leneva-Baranduda Precinct Structure Plan (PSP 1105).

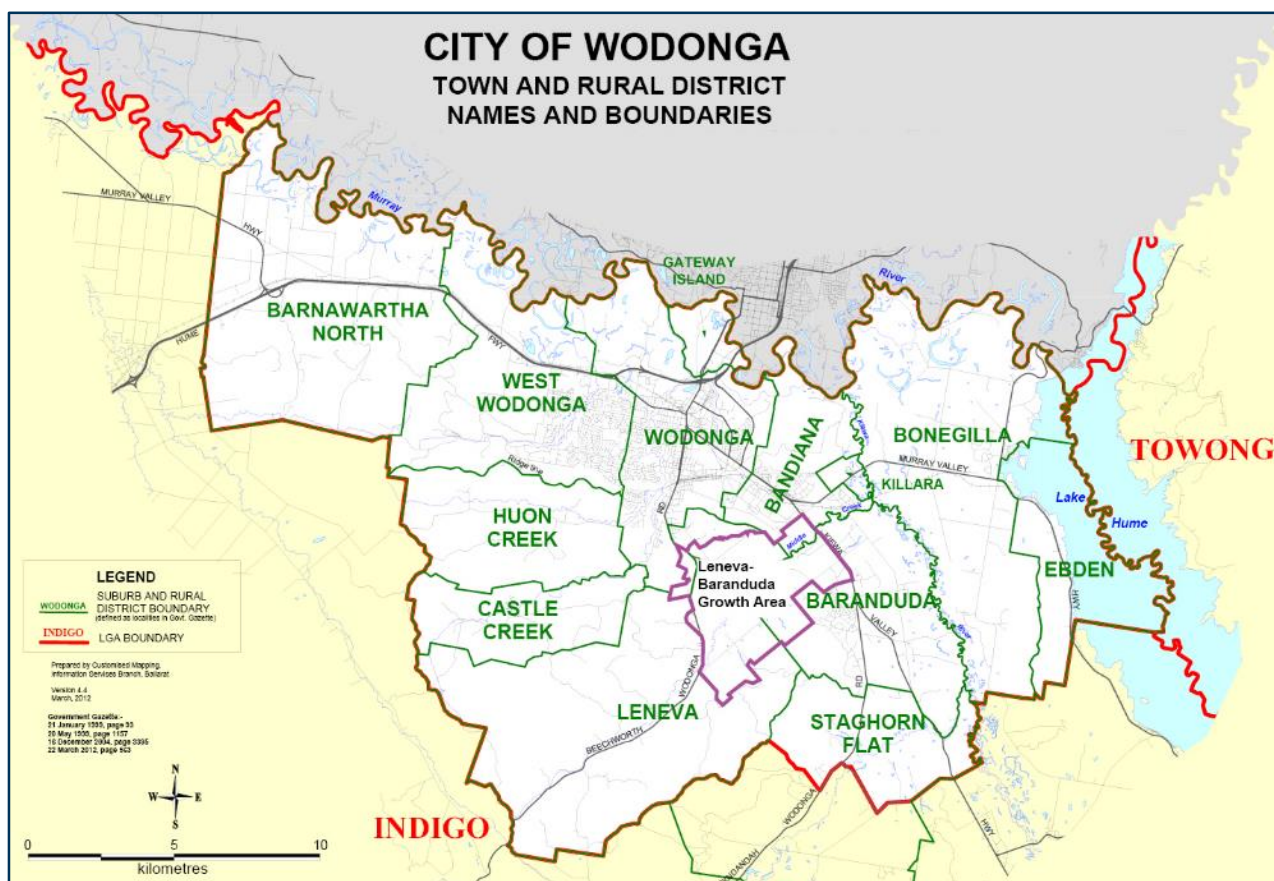

The outputs of the modelling completed by Cardno can be used to inform subsequent SIDRA modelling to determine intersection configurations, Functional Layout Plans (FLPs), Precinct Infrastructure Plans (PIPs) and Development Contribution Plans (DCPs) for the area.

The MPA is managing the preparation of PSP in consultation with the City of Wodonga Council who is the Planning Authority for the area.

1.2 Study Area

The Leneva-Baranduda Growth Area is located to the south west of Wodonga, and is expected to provide for approximately 13,000 new dwellings, with supporting educational and leisure facilities integrated around proposed activity/ neighbourhood centres. The location of the Leneva-Baranduda Growth Area within the greater Wodonga area is outlined in Figure 1-1.

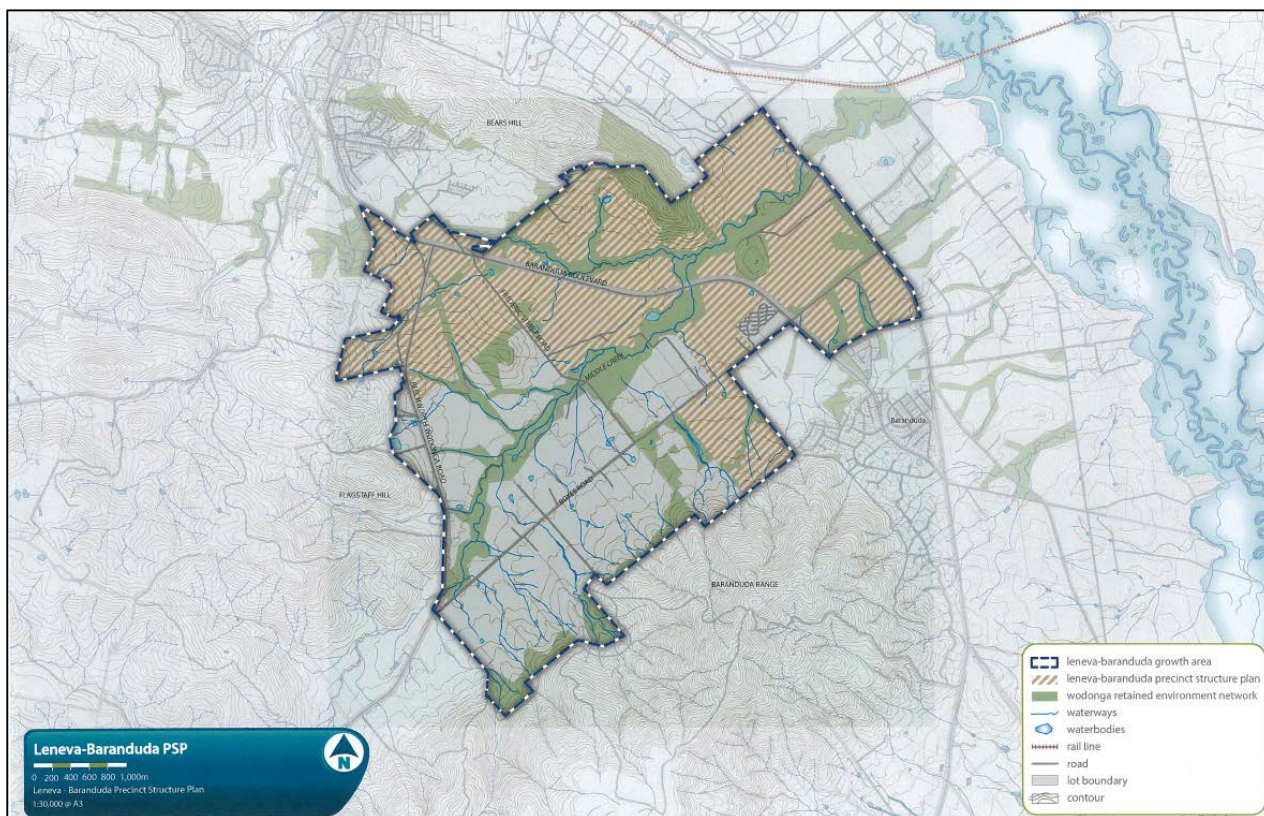

Figure 1-1 Leneva-Baranduda Growth Area in Context of Wodonga LGA

Source: Local Government Gazette (March 2012)

The PSP covers an area of approximately 1070 hectares within the Growth Area as outlined in Figure 1-2.

Figure 1-2 Leneva-Baranduda PSP (1105) Growth Area

The Growth Area is anticipated to accommodate predominantly residential uses and will also include activity centres, schools, community facilities, passive pen spaces and sporting reserves.

1.3 Referenced Documents

In developing the traffic models and preparing this report, the following data sources and reports have been considered:

- Wodonga Arterial Network Study (WANS) – Development of a Strategic Transport Model Report, prepared by CPG (dated April 2011).
- Wodonga Integrated Transport Strategy (WITS) prepared by GTA Consultants (dated February 2014).
- Discussion Draft Leneva-Baranduda Growth Area Framework Plan 2012, prepared by Loone Town Planning (dated May 2012).
- Council's Strategic Planning Unit's Map of Estates Currently Developable in Wodonga (dated 11 September 2014).
- Draft Future Urban Structure Concepts for the Leneva-Baranduda Growth Area prepared by the MPA.
- The Local Government Infrastructure Design Association's Infrastructure Design Manual, version 4.4 (dated 22 August 2015).
- Other documents and data sources as nominated throughout this report.

1.4 Interim (2026) vs. Ultimate (2046) Analysis

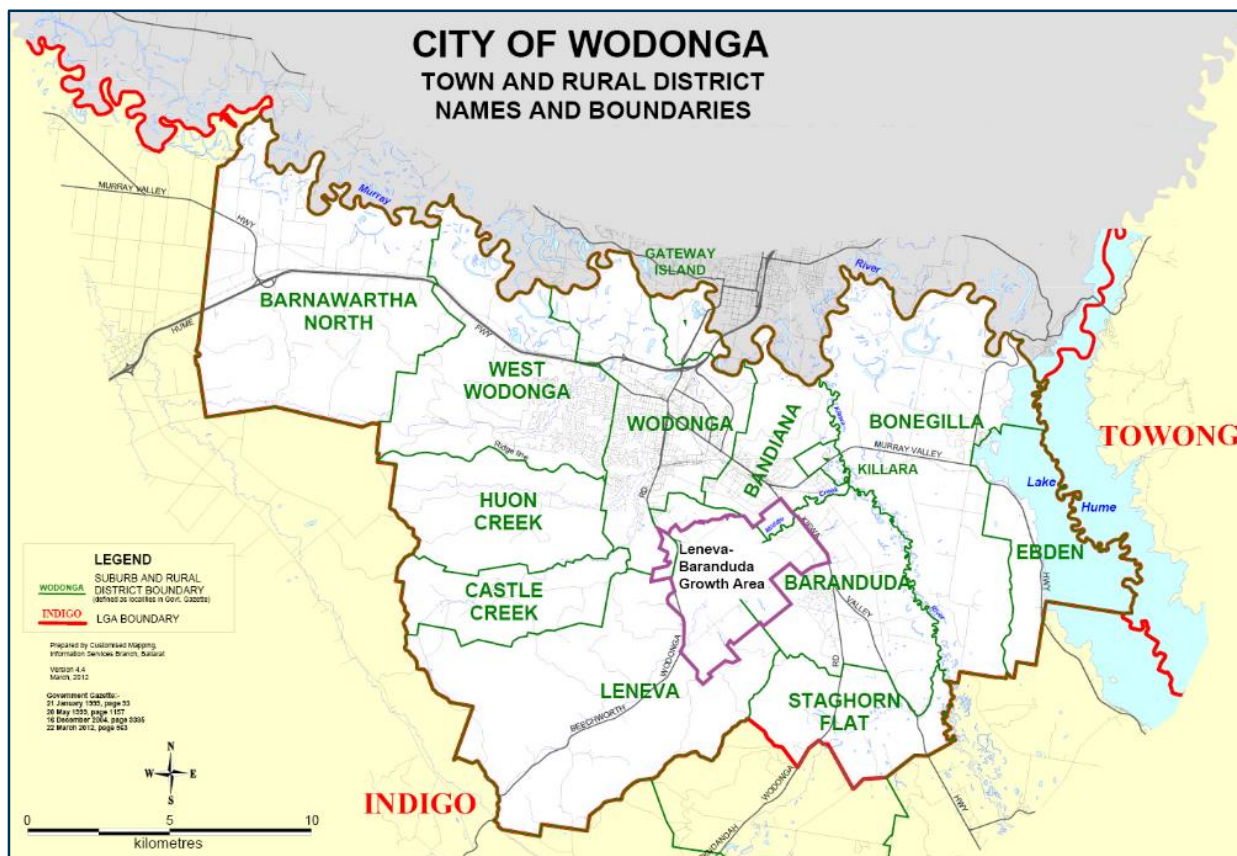

An assessment of both interim and ultimate traffic volumes are included in this report. The interim volumes represent the +10 year development scenario (~2026) and the ultimate volumes the +30 year development scenario (~2046). The interim volumes will be used to inform the scope of road network infrastructure required to facilitate the development of the Growth Area, whilst the ultimate volumes will be used to validate the ultimate road reservation requirements.

2 Leneva-Baranduda Growth Area and PSP 1105

2.1 The Leneva-Baranduda Growth Area Location

The Leneva-Baranduda Growth Area is located to the south west of Wodonga and is expected to provide for approximately 13,000 new dwellings, with supporting educational and activity centre and recreational uses. The location of the Leneva-Baranduda Growth Area within the greater Wodonga area is outlined in Figure 2-1.

Figure 2-1 Leneva-Baranduda Growth Area in Context of Wodonga LGA

Source: Local Government Gazette (March 2012)

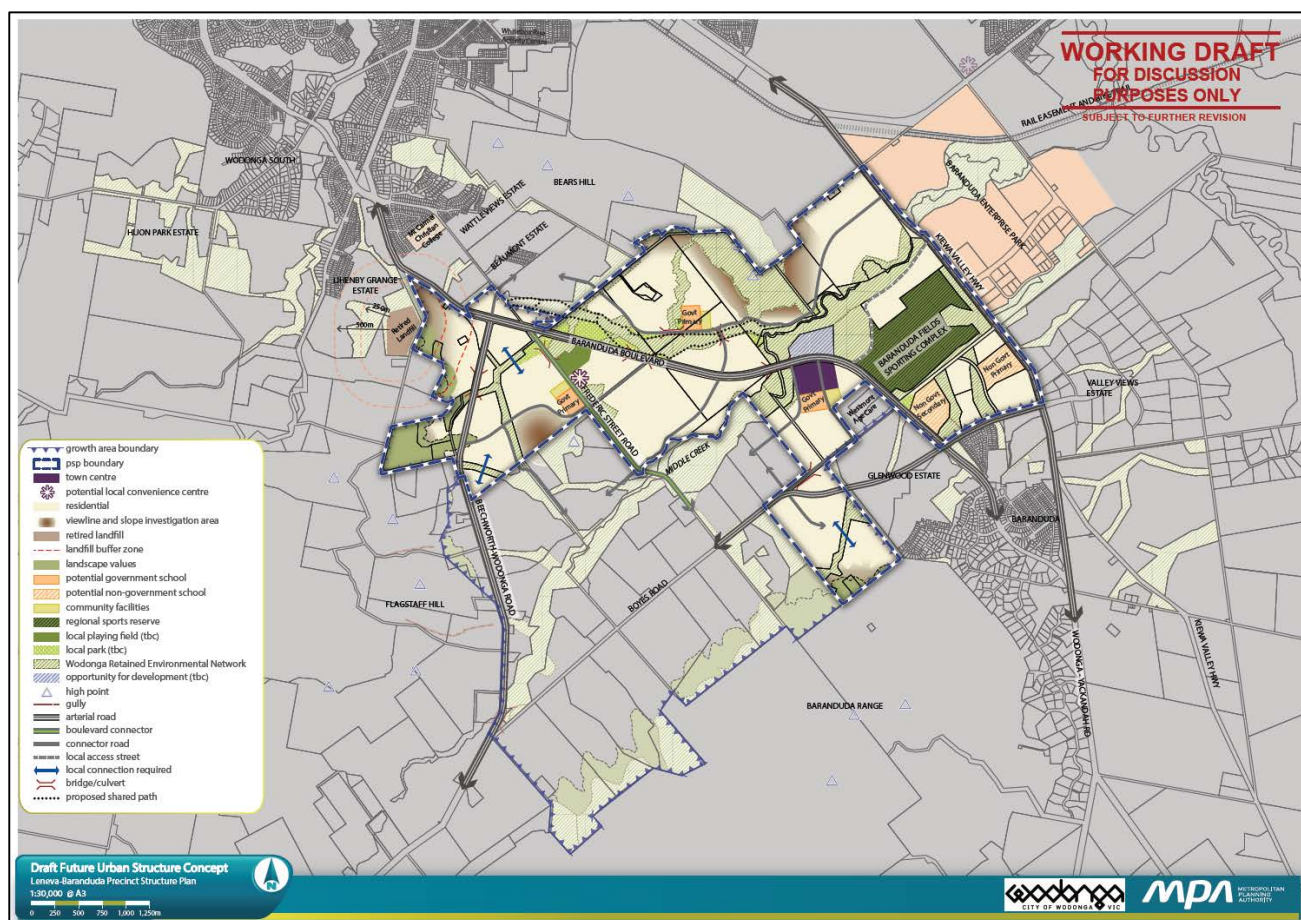

The City of Wodonga Council has identified Leneva-Baranduda as the priority growth area for Wodonga in the medium to long-term future.

2.2 The Leneva-Baranduda PSP (PSP 1105) Location

Leneva-Baranduda PSP (PSP 1105) area covers approximately 1070 hectares and is currently generally made up of farming land. It is anticipated that the PSP area will ultimately accommodate some 7,000 dwellings.

The PSP area generally covers the northern portion the Growth Area and the Draft Future Urban Structure for the PSP is shown in Figure 2-2 (with an enlarged version included in Appendix A).

Figure 2-2 Leneva-Baranduda (PSP 1105) – Draft Future Urban Structure

As outlined in Figure 2-2, the Baranduda Fields Sporting Complex lies within the PSP area and Middle Creek also runs through the PSP area. A notable portion of the Growth Area forms part of the “Wodonga Retained Environmental Network” which constrains the permeability of the transport network.

The PSP area is also bound by Flagstaff Hill to the west, Baranduda Range to the south-east, Kiewa Valley Highway to the north-east, and Bears Hill to the north, and the existing Baranduda Township to the south-east.

The Growth Area is also bordered by the Baranduda Enterprise Park industrial estate, a significant employment node, to the east.

2.3 Existing and Proposed Road Network Overview

Baranduda Boulevard is the existing key north-south road through the PSP area and runs from the Kiewa Valley Highway in the Baranduda Township to Beechworth-Wodonga Rd to the south of the Leneva Township. Boyes Road is the key existing east-west road through the Growth Area, it currently runs from Ellen McDonald Drive in the east to Beechworth-Wodonga Rd in the west. It is envisaged that Boyes Road will be upgraded to an Arterial Road in the future and extended further south-east to connect to Kiewa Valley Highway.

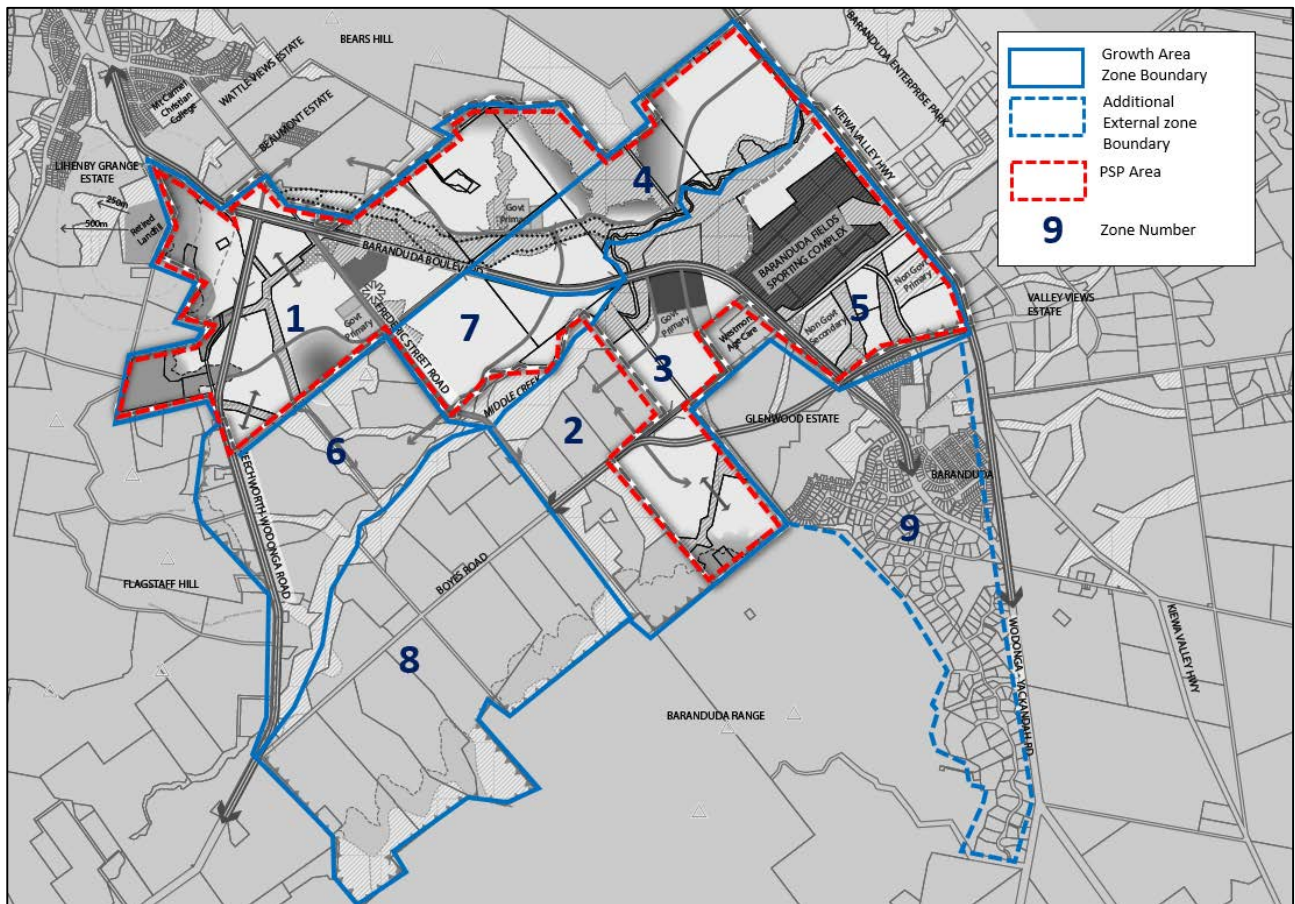

The proposed road network for the Growth Area is outlined in Figure 2-2 and consists of a series of Connector Streets with bridge river crossings. The Connector Street network within the Growth Area connects to the wider road network via intersections with the existing Arterial Road and Local Road networks.

2.4 Land Use Forecasts for the Growth Area and PSP

As outlined in Figure 2-2, the Draft Future Urban Structure for Leneva-Baranduda includes residential, Local Town Centre (LTC) educational facilities, community facilities, and passive and active open space provisions.

As discussed in more detail later in this report, for the purposes of the traffic modelling, the study area has been divided into nine 'zones', whereby the various proposed land uses have been allocated as per the Draft Future Urban Structure provided by the MPA. These zones are shown in Figure 2-3.

Figure 2-3 Proposed Growth Area Traffic Modelling Zones

With an understanding of the proportion and numbers/ sizes of each land use types within each zone, the trip generation due to the development within each zone can be calculated, as discussed later in Section 4-6 of this report.

The anticipated development yields for the PSP area and Growth Area are outlined in Table 2-1.

Table 2-1 Ultimate Anticipated Development Yields

Growth Area Zone (PSP)	Population	No. Households	Retail Floor Area (sqm)	Enrolments (no. students)	Employment (No. jobs)
1 (PSP)	8,457	3,317	1,500	451 [1]	
2	1,947	763			
3 (PSP)	2,577	1,011	10,000	451 [1]	1,800 [3]
4 (PSP)	3,645	1,429		451 [1]	
5 (PSP)	974	382		1,100 [2]	
6	3,621	1,420			
7 (PSP)	2,372	930			
8	9,730	3,816			
Total PSP	18,026	7,069	11,500	2,453	1,800
Total Growth Area (1-8)	33,324	13,068	11,500	2,453	1,800

[1] Government Primary School.

[2] Private Primary and Secondary School.

[3] Council owned 9 hectare land parcel. Number of jobs estimated by assuming that half the site will be developable floor area and applying a job rate of 4 jobs per 100sqm developable floor area.

The residential land use yields for the Growth Area were derived on the basis that the net developable area (NDA) for the PSP area is 642.6 hectares and the remainder of the Growth Area has a NDA of 545.4 hectares, and then applying a dwelling rate of 11 dwellings per hectare of NDA.

3 Existing and Future Road Network

3.1 Overview

The Leneva-Baranduda Growth Area is bordered by Beechworth-Wodonga Road to the west, and the Kiewa Valley Highway to the east. Within the Growth Area, the existing road network is made up of Baranduda Boulevard, Boyes Road, and Frederic Street Road.

Further discussion on the existing and future network is provided in the following subsections.

3.2 Beechworth-Wodonga Road

Wodonga-Beechworth Road, a VicRoads controlled Arterial Road, extends from the roundabout intersection with Baranduda Boulevard and Beechworth Road in the north-western corner of the Growth Area, along the western boundary of the Growth Area and south through to Beechworth. It is an extension of Beechworth Road which is an Arterial Road extending south from Wodonga City Centre.

The road is currently an undivided two-way, two-lane road and is envisaged by VicRoads to remain in its current configuration under ultimate (2046) conditions.

3.3 Kiewa Valley Highway

The Kiewa Valley Highway VicRoads controlled Arterial Road that extends south from Thomas Mitchell Drive / Murray Valley Highway which extends east from Wodonga City Centre. It passes along the north east boundary of the PSP area between the Baranduda Enterprise Park and onwards south to Baranduda where the road splits to Kiewa or Yackandandah just north of the Baranduda.

The Kiewa Valley Highway between the Murray Valley Highway turn off and Baranduda is envisaged by VicRoads to become a dual carriageway Arterial Road with two lanes in each direction under ultimate (2046) conditions.

3.4 Baranduda Boulevard

Baranduda Boulevard is currently an undivided two-way two-lane road connection through the PSP area between the Beechworth-Wodonga Road roundabout and the Yackandandah-Wodonga Rd in Baranduda Township with one lane in each direction.

The Draft Future Urban Structure for the PSP anticipates the upgrade of Baranduda Boulevard to a Secondary Arterial Road (two-way, four-lane) linking the Connector Streets within the Leneva-Baranduda Growth Area to the external Arterial Road network.

It is also expected that its roundabout intersection with Beechworth-Wodonga Road will be upgraded to a signalised intersection in the ultimate scenario.

3.5 Boyes Road

Boyes Road is currently an undivided two-way, two-lane road connection through the PSP area between Ellen McDonald Drive in the east to Beechworth-Wodonga Rd in the west.

Boyes Road is proposed to be upgraded to a Secondary Arterial Road and extended further south east Kiewa Valley Highway as part of the development of the Growth Area. Ultimately the draft Future Urban Structure indicates that Boyes Road will be upgrade from a local road to a Secondary Arterial Road (divided two-way, four lanes).

3.6 Frederic Street Road

Frederic Street Road is currently an undivided two-way, two-lane road connection through the PSP area between Boyes Road in the south and Baranduda Boulevard in the north. Ultimately the draft Future Urban Structure indicates that Frederic Street Road will be upgrade from a local road to a Boulevard Connector Street (divided two-way, two-lane).

3.7 Future Connector and Local Access Streets within the Growth Area

3.7.1 Connector Streets

The proposed Connector Street network within the PSP area will connect neighbourhoods and link to the Local Access Streets to the Arterial Road network. These streets will have a single traffic lane in each direction. The local Government Infrastructure design Association's Infrastructure design Manual (IDM), version 4.4, dated 22 August 2015, notes that Connector street (level 1) can carry volumes up to 6,000 vehicles per day.

3.7.2 Local Access Streets

Local Access Streets within the Growth Area are expected to consist of lanes, loops and through streets between Connector Streets. Local Access Streets will have a single traffic lane in each direction and carry volumes up to 2,500 vehicles per day in accordance with the IDM.

3.8 Summary of Existing and Proposed Road Cross Sections

Based on the above outlined road characteristics, the existing and proposed cross sections for key roads within and surrounding the study area are summarised in Table 3-1.

Table 3-1 Existing and Proposed Future Road Cross Sections

Road	Existing Configuration	Proposed Future Configuration
Beechworth-Wodonga Road	Two-way, two-lane undivided Arterial Road	Two-way, two-lane Arterial Road
Kiewa Valley Highway	Two-way, two-lane undivided Arterial Road	Two-way, four-lane Arterial Road
Baranduda Boulevard	Two-way, two-lane local road	Two-way, four-lane Arterial Road
Boyes Road	Two-way, two-lane local road	Two-way, four lane Arterial Road
Frederic Street Road	Two-way, two-lane local road	Two-way, two-lane Boulevard Connector Street

4 Traffic Modelling Overview

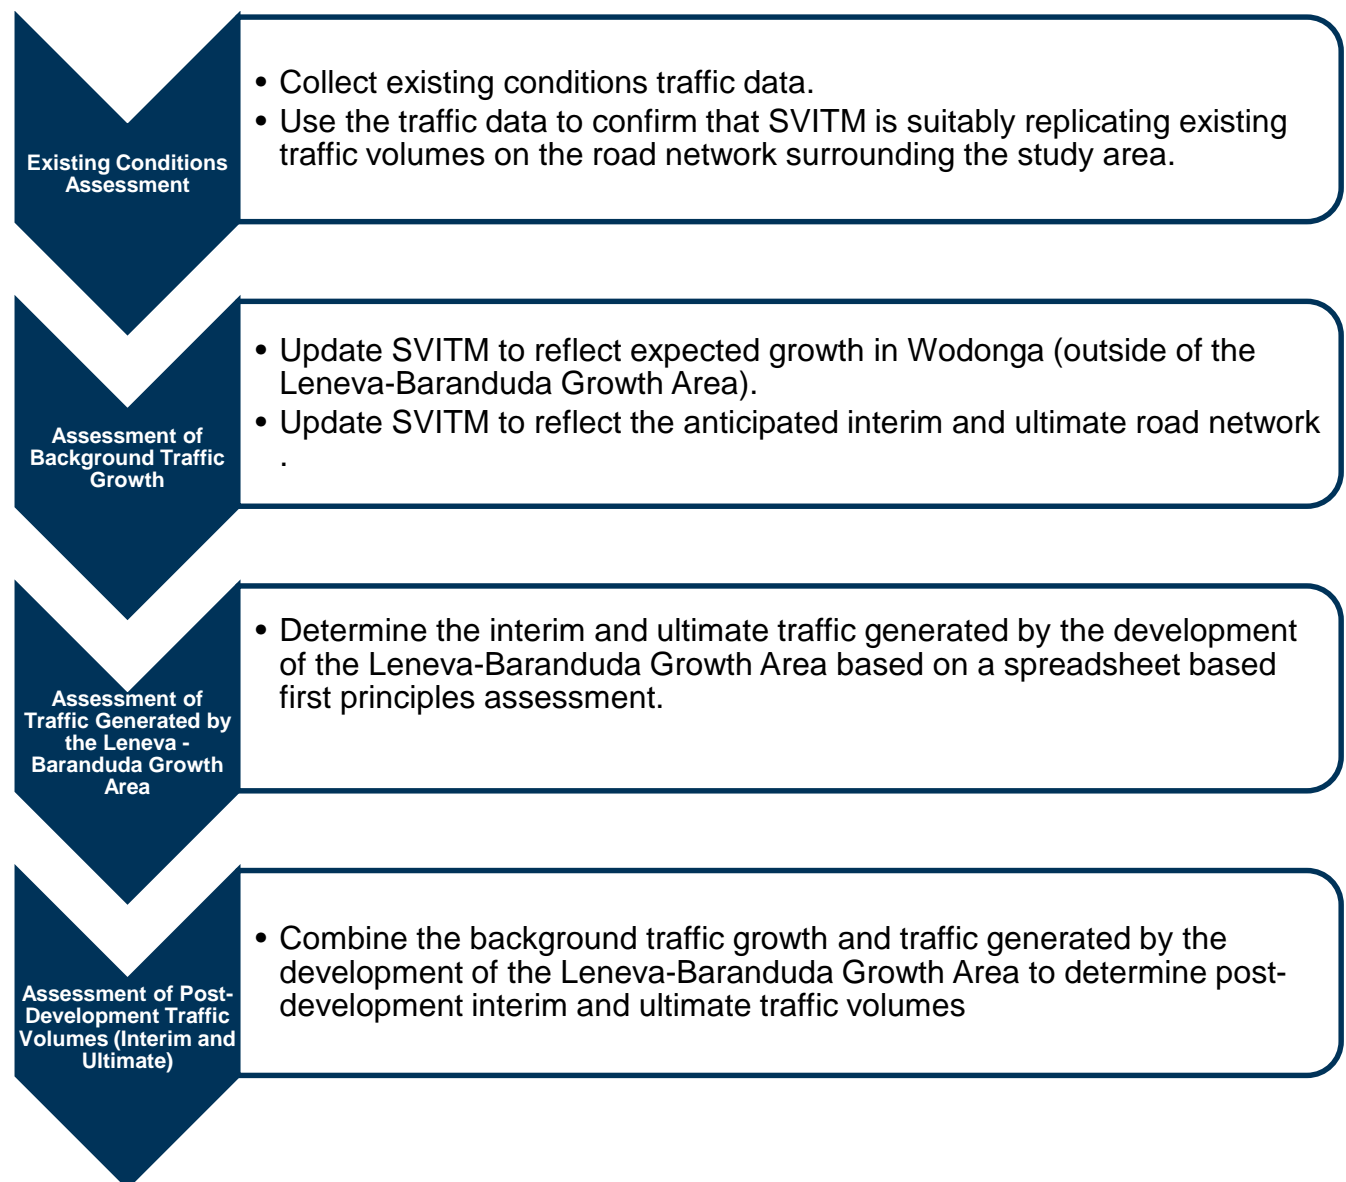

4.1 Modelling Methodology

The modelling methodology adopted for this study uses strategic modelling to assess the background traffic growth and first principles spreadsheet modelling to assess the traffic generated by the development of the Leneva-Baranduda Growth Area.

The strategic modelling component of the methodology entailed using the State-wide Victorian Integrated Transport Model (SVITM), a tool developed and maintained by the Department of Economic, Development, Jobs, Transport and Resources (DEDJTR) to assist in the planning of road and public transport infrastructure in Victoria. SVITM uses future population, employment and land use data projections to forecast travel behaviour and the impacts of changes to the road and network. The model is a link-based traffic model which is implemented in the CUBE Voyager software environment.

The modelling approach for assessing the expected interim (2026) and ultimate (2046) traffic volumes on the road network is outlined Figure 4-1.

Figure 4-1 Modelling Methodology

As outlined in Figure 4-1, the modelling methodology involved the following:

1. Assessing the current traffic volumes on the existing road network.
2. Assessing the background traffic growth and distribution on the wider road network on the basis that the Leneva-Baranduda is not developed and all other known development areas in Wodonga are fully developed.
3. Assessing the traffic generated by the development of the Leneva-Baranduda Growth Area by spreadsheet modelling in order to gain a more detailed understanding of the PSP traffic generation and the internal traffic generation within the Growth Area.
4. Combining the background traffic volumes and the traffic generated by the Leneva-Baranduda Growth Area to obtain “post-development” traffic volumes for the interim (2026) and ultimate (2046) scenarios.

4.2 Assessment of Existing Traffic Volumes

Existing conditions traffic data was sourced the Wodonga Arterial Network Study (WANS), Council’s traffic survey data, available VicRoads survey data, and additional data collected by Cardno. This data was used to confirm that the SVITM was suitably replicating existing traffic volumes on road network surrounding the study area. Details of the collected survey data is provided in Appendix B.

4.3 Modelling Assumptions

The following assumptions were used in regard to the interim and ultimate development scenarios:

Interim (2026) Assessment

1. 75% of the entire Leneva-Baranduda Growth Area has been developed.
2. All other known residential development areas in Wodonga are 100% developed.
3. All Arterial Roads (Baranduda Boulevard, Kiewa Valley Highway, and Beechworth Wodonga Road) in the vicinity of the PSP area are two-way, two-lane roads.

Ultimate (2046) Assessment

1. 100% of the Leneva-Baranduda Growth Area has been developed.
2. Baranduda Boulevard and Beechworth Wodonga Road in the vicinity of the PSP area are undivided two-way, two-lane roads.
3. Kiewa Valley Highway in the vicinity of the PSP area is a two-way four-lane road.
4. Boyes Road is a two-way four-lane road that is extended further south-east to Kiewa Valley Highway.

5 Strategic Modelling Assessment of Background Traffic Volumes and Distributions

5.1 State-wide Victorian Integrated Transport Model (SVITM)

As outlined in Section 4.1, the State-wide Victorian Integrated Transport Model (SVITM) has been used to provide future year background and traffic growth and distribution data for this study. A copy of the model was sourced from the DEDJTR and validated for the Wodonga area such that it was suitable for future year testing.

The SVITM is a simplified representation of the real world and as such is used as a decision guidance tool. The transport model's strengths lie in indicating the likely scale of changes brought about by the implementation of transport infrastructure schemes, land use changes or policy driver measures, and the use of outputs in a sensible and pragmatic manner.

The outputs of the transport model have to be interpreted in accordance with the design of the model, taking into account the complexity of the model and its probable robustness. The benefit of using SVITM is that once it is validated for an existing situation, it can be used to forecast the effects of a variety of future land uses, transport infrastructure and/or policy changes on travel.

5.2 Refinement of the SVITM

5.2.1 Zone Structure Refinements

On review of the DEDJTR SVITM zone structure it was found to be a good base for Wodonga CBD area (sufficiently detailed in terms of zone sizes), however it did not have a sufficient zone structure to assess the Leneva-Baranduda Growth Area. For the purposes of this study nine new zones have been created within the study area, as previously outlined in Section 2.4.

The SVITM zone structures prior and after the zone refinement process are shown in Figure 5-1 and Figure 5-2 respectively.

Figure 5-1 SVITM Zone Structure Before Refinements

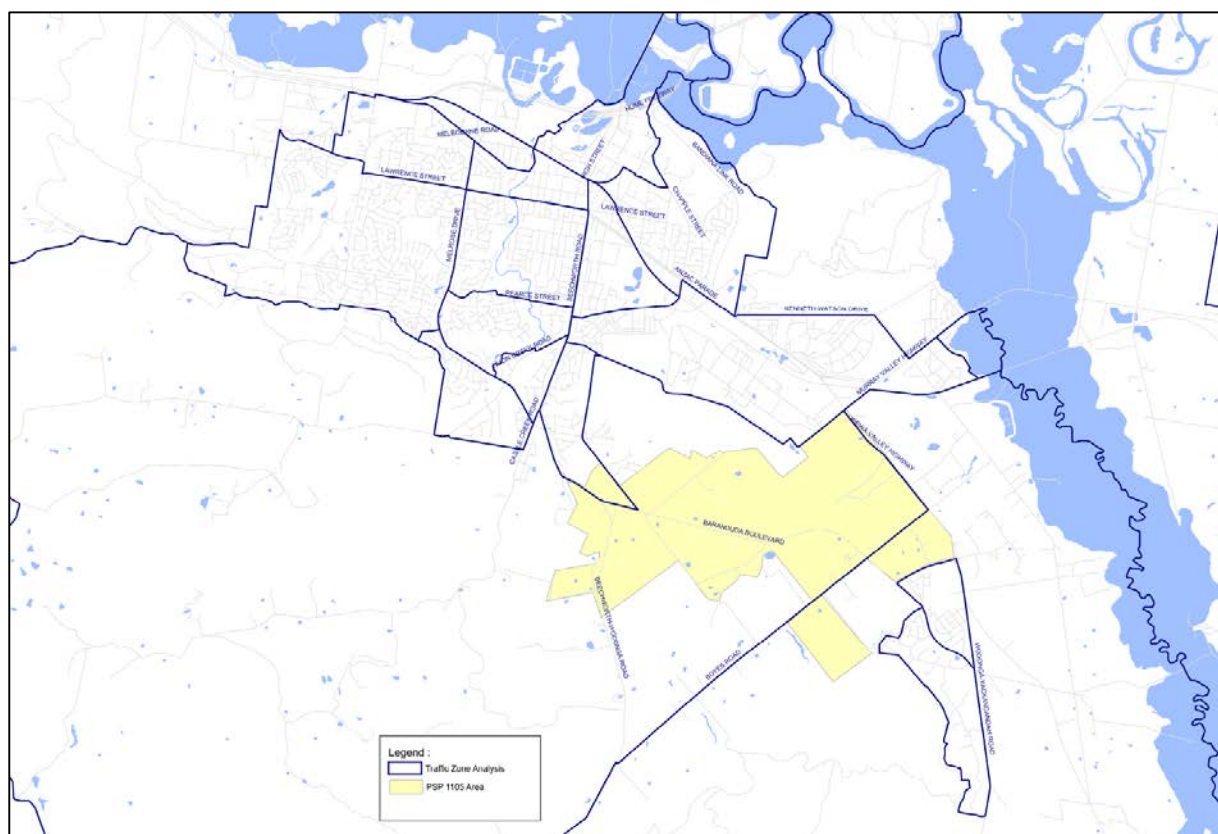

Figure 5-2 SVITM Zone Structure After Refinements

5.2.2 Road Network Refinements

In order to inform the future background traffic growth and distribution, the existing SVITM road network was also updated and refined to reflect existing and anticipated strategic network modifications within the Leneva-Baranduda Growth Area.

Figure 5-3 and Figure 5-4 show the adopted Base Case (existing conditions) and Interim / Ultimate Development Scenario road networks respectively.

Figure 5-3 Base Year Modelled Road Network

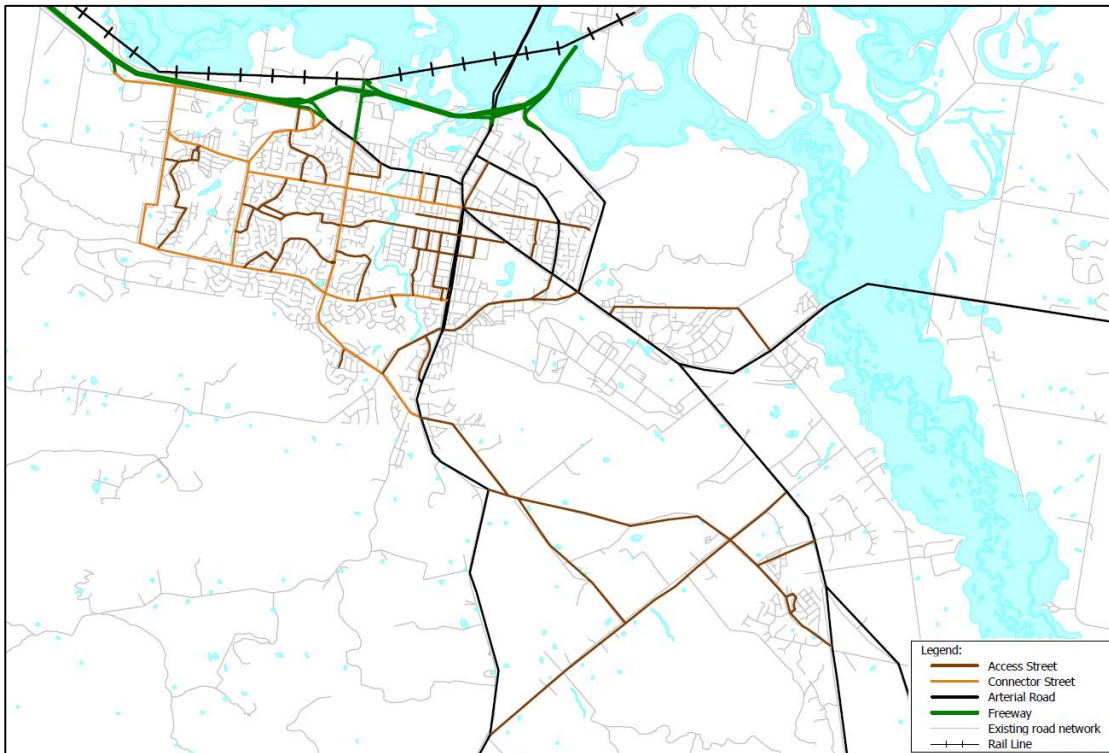

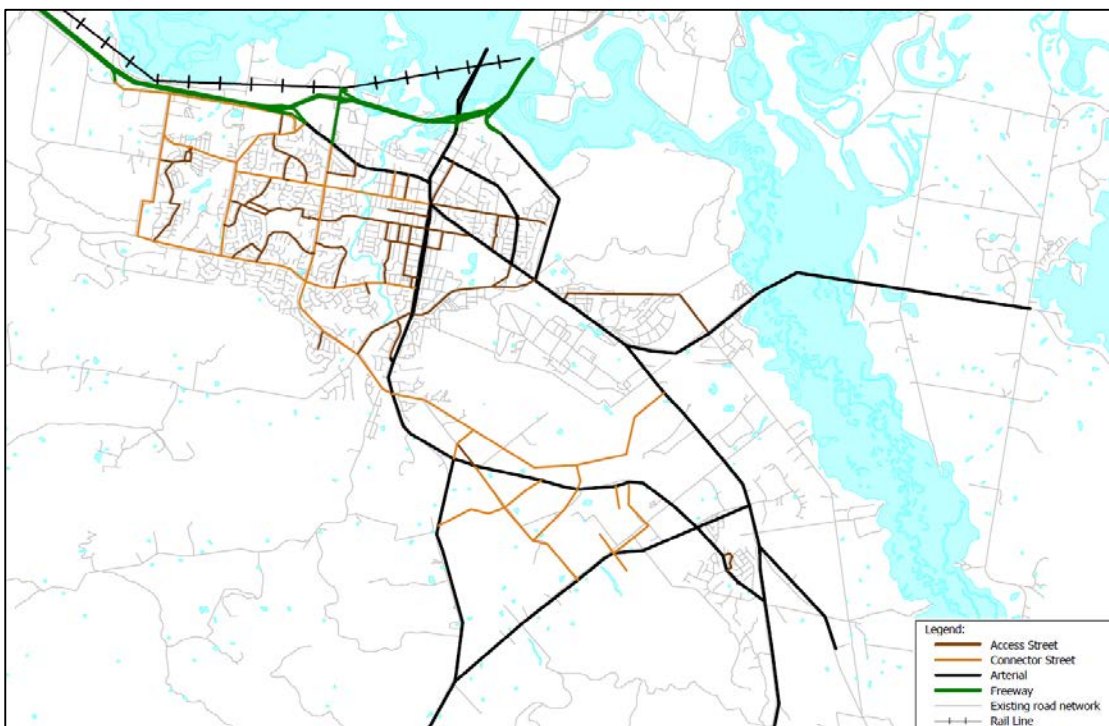

Figure 5-4 Interim and Ultimate Scenario Modelled Road Network

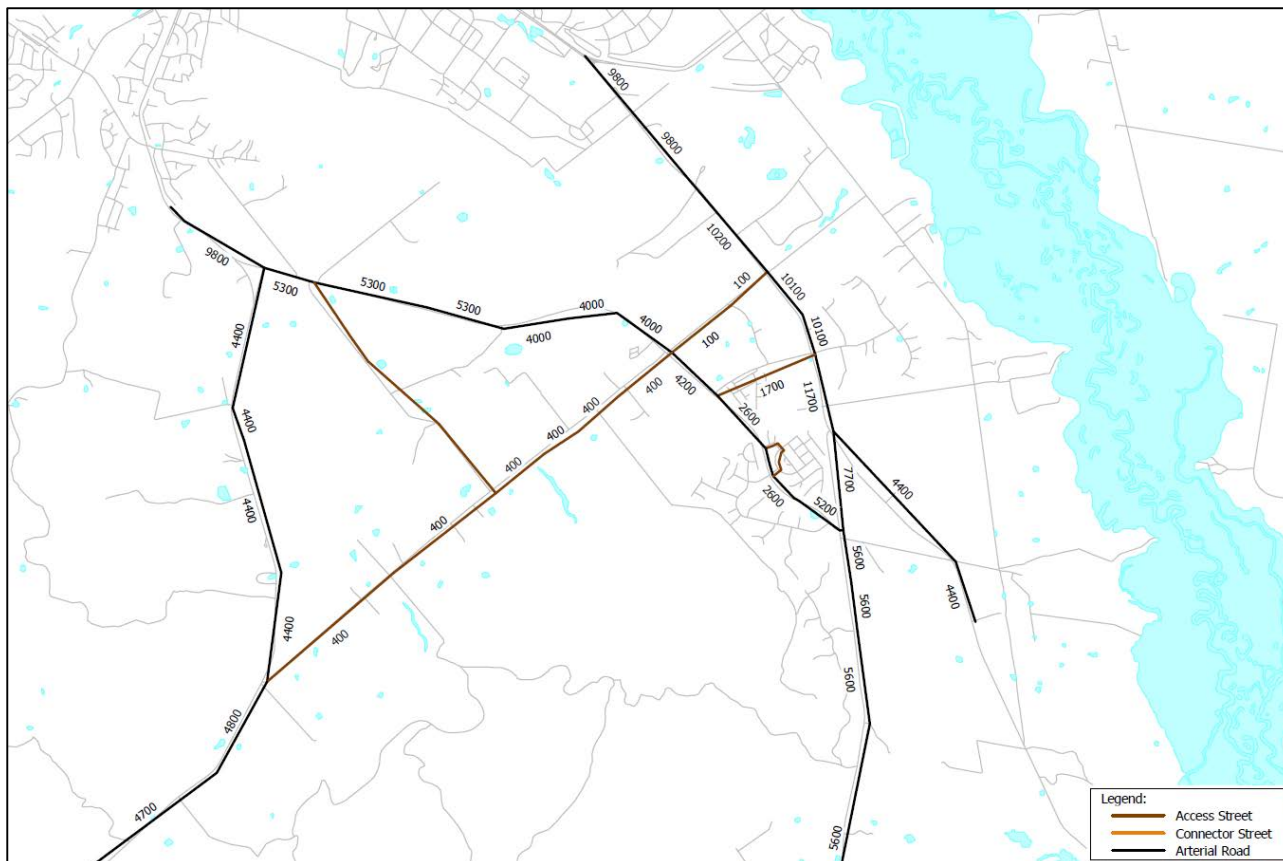

The modelled road network was also cross-checked against the Wodonga Arterial Network Study (WANS) road network and found to be consistent with the WANS recommendations.

5.3 Base Year Model Validation

The base year SVITM model was validated to ensure that it was “fit for purpose” in terms of assessing background traffic volume growth and travel patterns. The outcomes of this validation are included in Appendix C, and the base case modelled daily traffic volumes are summarised in Figure 5-5.

Figure 5-5 Modelled Base Case Daily Traffic Volumes (2-way)

5.4 Land Use Inputs

Zone demographic data for the Wodonga CBD area was sourced from the WANS study report and data provided by MPA in relation to developable estates in Wodonga (included in Appendix D). The land use data was grouped in order to correlate to the SVITM zone structure previously shown in Figure 5-2.

The draft Future Urban Structure Plan previously outlined in Figure 2-2 shows the proposed land uses within the Leneva-Baranduda Growth Area, and Figure 5-2 previously showed the additional zones incorporated into the SVITM in order to better reflect the proposed land uses within the Growth Area.

The modelled land use data inputted into SVITM for both the interim and ultimate assessment years for the purposes of assessing background traffic growth are shown in Table 5-1.

Table 5-1 SVITM Background Growth Land Use Inputs

Zone	Base Case (2011)			Interim (2026)			Ultimate (2046)		
	Dwelling	Jobs	Enrolments	Dwelling	Jobs	Enrolments	Dwelling	Jobs	Enrolments
1	-	-	-	-	-	-	-	-	-
2	-	-	-	-	-	-	-	-	-

9	1,035	120	-	1,730	213	-	2,180	274	-
10	455	742	-	2,775	1,162	-	3,700	1,383	-
11	1,216	3,113	-	1,383	3,656	-	1,492	3,798	-
12	280	3,042	340	260	4,037	380	264	4,460	380
13	170	1,294	-	180	1,429	-	180	1,483	-
14	702	2,405	500	735	2,640	500	748	2,788	500
15	2,329	1,062	1,395	2,439	1,204	1,580	2,488	1,268	1,685
16	691	210	490	710	260	535	712	283	550
17	841	96	-	1,153	142	-	1,345	169	-
18	205	24	-	210	26	-	210	26	-
19	1,450	2,222	2,425	1,770	2,382	3,050	1,900	2,453	3,310
20	4,080	847	1,550	4,254	1,053	1,815	4,346	1,097	1,950
21	1,141	165	390	2,250	268	465	3,000	295	500
22	993	750	1,800	1,148	864	1,980	1,205	1,066	2,080
23				-	2,800	-	-	3,250	-
Total	15,587	16,088	9,770	20,995	22,246	11,935	23,770	24,225	12,835

The above outlined land use yields indicate that notable growth is expected to the north of the Leneva-Baranduda Growth Area study area between 2011 and 2026 with the rate of growth generally expected to decrease between 2026 and 2046.

6 First Principles Assessment of the Study Area Generated Traffic

6.1 Overview

The Leneva-Baranduda Growth Area. This assessment involved applying empirical traffic generation rates to the proposed land uses and distributing the trips onto the wider road network. The following subsections discuss the adopted traffic generation rates and the traffic distribution methodology.

6.2 Adopted Traffic Generation Rates

The adopted traffic generation rates for the various proposed land uses have been sourced from rates adopted in the assessment of other growth area PSPs, Cardno's case study data and the New South Wales Road and Traffic Authority (RTA) "Guide to Traffic Generating Development" document. The rates adopted for the various land uses are outlined in the following subsections.

6.2.1 Residential Dwellings

The RTA Guide suggests a peak hour trip rate of 0.85 trips per dwelling and a daily trip rate of 9 trips per dwelling. These rates are based on surveys conducted in areas where new residential subdivisions, initially with limited public transport accessibility, are being built.

The above rates are consistent with case study data collected by Cardno for residential developments in Inverloch, Lysterfield and Nillumbik.

Accordingly a peak hour rate of 0.85 trips per dwelling and a daily trip rate of 9 trips per dwelling have been adopted for the purposes of this study.

In addition, in accordance with the RTA Guide, it has been assumed that 25% of the trips will be internal to the Leneva Baranduda Growth Area involving local shopping and employment, schools and local social activities.

6.2.2 Education Uses

An AM peak trip rate of 0.75 trips per student and a daily trip rate of 1.5 trips per student have been adopted for the purposes of this assessment. These rates are consistent with the rates adopted by the MPA in assessing PSPs in growth areas. The adopted rates are also consistent with case study data collected by Cardno for schools in Mildura and Clyde North.

In addition a conservative trip generation rate of 0.25 trips per student has been adopted for the PM commuter peak hour. The rate is considered conservative on the basis that the afternoon school pick up peak and the evening commuted peak hour do not generally coincide.

6.2.3 Activity Centres

In order to assess the likely traffic generation of the Local Town Centre (LTC), reference is made to the RTA Guide. It is anticipated that the LTC will essentially operate as small shopping centre servicing the needs of the local community.

For shopping centres up to 10,000sqm in floor space, the RTA Guide suggests a daily traffic generation rate of 121 trips per 100sqm and 12.5 trips per 100sqm during the evening commuter peak hour.

In regards to the AM commuter peak the RTA Guide does not suggest a trip rate, similarly limited case study data is available for the AM peak period. For the purposes of this assessment it has been assumed that the AM peak trip rate will be 10% of the PM peak trip rate (i.e. 1.25 trips per 100 sqm) to account with staff and servicing activities.

The above outlined rates are consistent with rates adopted by the MPA in the preparation of PSPs in other growth areas.

6.2.4 Other Employment

Cardno has been advised that Council owns a 9 hectare parcel of land opposite the proposed LTC on Baranduda Boulevard. It is understood that Council it intends to preserve this site preserved for future opportunities (such as an emergency centre, library, university, hospital, medical centre, Regional Park and/or combination).

Given the uncertainty in relation the eventual land use that will be developed on this land parcel, Cardno has assumed the following for the purposes of this study:

1. 50% of the site will be developable floor area.
2. An employment density of four jobs per 100 sqm developable floor area based on employment densities for office and commercial uses outlined in the RTA Guide.
3. A peak hour trip rate of 0.75 trips per employee and a daily trip rate of 1.5 trips per employee.

6.2.5 Baranduda Enterprise Park

Given the proximity of the Baranduda Enterprise Park to the Leneva–Baranduda Growth Area, it was assessed on a first principles basis as part of the spreadsheet modelling.

For the purposes of this assessment it was assumed that the 265 hectare industrial site has a job density of 12.17 jobs per hectare based on the job density used in the transport modelling for the Croskell PSP in Melbourne's South-East Growth Corridor. In addition it was assumed that the site will be 75% developed in the interim scenario and 100% developed in the ultimate scenario.

A peak hour trip rate of 0.75 trips per employee and a daily trip rate of 1.5 trips per employee were subsequently adopted.

Accordingly, the Baranduda Enterprise Park Industrial Estate is ultimately anticipated to generate some 2,420 trips during the peak hours, and some 4,840 daily trips.

6.2.6 Summary of Adopted Trip Generation Rates

Based on the above outlined discussions, the adopted traffic generation rates are summarised in Table 6-1:

Table 6-1 Adopted Traffic Generation Rates

Use	AM Peak Rate	PM Peak Rate	Daily Rate
Residential	0.85 trips per dwelling	0.85 trips per dwelling	9 trips per dwelling
School	0.75 trips per student	0.25 trips per student	1.5 trips per student
Activity Centre	1.25 trips per 100sqm	12.5 trips per 100sqm	121 trips per 100sqm
Other Employment / Baranduda Enterprise Park	0.75 trips per employee	0.75 trips per employee	1.5 trips per employee

6.3 Traffic Distribution

The background traffic data including the future directional distribution of external trips generated by the Growth Area for this model was informed by the SVITM.

The internal traffic generation and distribution was modelled using a first principles approach with consideration given to trip attractors (such as the LTC and schools) within the Growth Area. In order to determine the volumes on the roads within the Growth Area, the user equilibrium with capacity restraint traffic assignment method has been used to estimate trip assignment. The capacity restraint assignment process is an equilibrium assignment process by which trips are loaded incrementally onto the network and road link travel times are iteratively recalculated based on a cost function that reflects link capacity. This method assumes that drivers will choose path with the least associated cost. The iteration process stops when a driver cannot reduce travel costs by shifting to another route.

6.4 Leneva-Baranduda Growth Area Generated Traffic Volumes

Based on the assumptions outlined above, the resulting ultimate traffic generation for the PSP area and wider Leneva-Baranduda Growth Area are summarised in Table 6-2:

Table 6-2 Leneva-Baranduda Growth Area Generated Traffic Volumes

Growth Area Zone (PSP)	No. Households	Retail Floor Area (sqm)	Enrolments (no. students)	Employment (No. jobs)	AM Peak Hour Trips	PM Peak Hour Trips	Daily Trips
1 (PSP)	3,317	1,500	451		3,176	3,120	32,345
2	763				649	649	6,867
3 (PSP)	1,011	10,000	451	1,800	2,673	2,672	24,576
4 (PSP)	1,429		451		1,553	1,327	13,538
5 (PSP)	382		1,100		1,150	600	5,088
6	1,420				1,207	1,207	12,780
7 (PSP)	930				791	791	8,370
8	3,816				3,244	3,244	34,344
PSP 1055 Total	7,069	11,500	2,453	1,800	9,342	8,509	83,916
Growth Area Total	13,068	11,500	2,453	1,800	14,441	13,609	137,907

As outlined in Table 6-2 the Growth Area is ultimately expected to generate some 14,400 trips during the AM peak hour, some 13,600 trips during the PM peak hour, and some 138,000 daily trips.

It is however expected that 25% of the trips will be internal within the Leneva-Baranduda Growth Area, therefore the trips generated onto the wider road network are expected to be in the order of some 103,430 trips per day, some 62,940 of which will be from the PSP area.

7 Assessment of Interim and Ultimate Traffic Volumes

7.1 Overview

Based on the assumptions and analysis outlined in Sections 4 to 6, the background growth, Growth Area generated and post-development traffic volumes for the interim and ultimate scenarios are outlined in the following sub-sections.

Reference is made in the following subsections to the capacity of the various road types. These capacities have been sourced from the Infrastructure Design Manual (for Access and Connector Streets), and from MPA's PSP Notes – our Roads: Connecting People for the Arterial Roads, are summarised in Table 7-1:

Table 7-1 MPA Road Classifications and Capacities

Road Type	Capacity (vehicles per day)	Traffic Lane Configuration
Access Street	1,000 - 2,500	2-way, 2-lanes
Connector Street Level 1	2,500 – 6,000	2-way, 2-lanes
Secondary (Local) Arterial	12,000 – 40,000[1]	2-way, 4-lanes
Primary Arterial	Greater than 30,000	2-way, 6-lanes

[1] Clause 56 of the Planning Scheme indicates that Arterial Roads carry more than 7,000vpd. The PSP Notes aim to provide a refined hierarchy to allow the more responsive development of land use and transport interactions to support the integration objective of the Transport Integration Act (2010).

In addition, reference is made to the Austroads Standards “Guide to Traffic Management – Part 3 Traffic Studies and Analysis” document which provides guidance on the daily traffic carrying capacity of urban roads. The daily capacity limits set out in this Austroads document are summarised in Table 7-2.

Table 7-2 Austroads Theoretical Daily Capacities

Road Type	Theoretical Daily Capacity (vehicles per day)
2-lane road	18,000
4-lane road	36,000
6-lane road	54,000

7.2 Interim (2026) Daily Traffic Volume Assessment

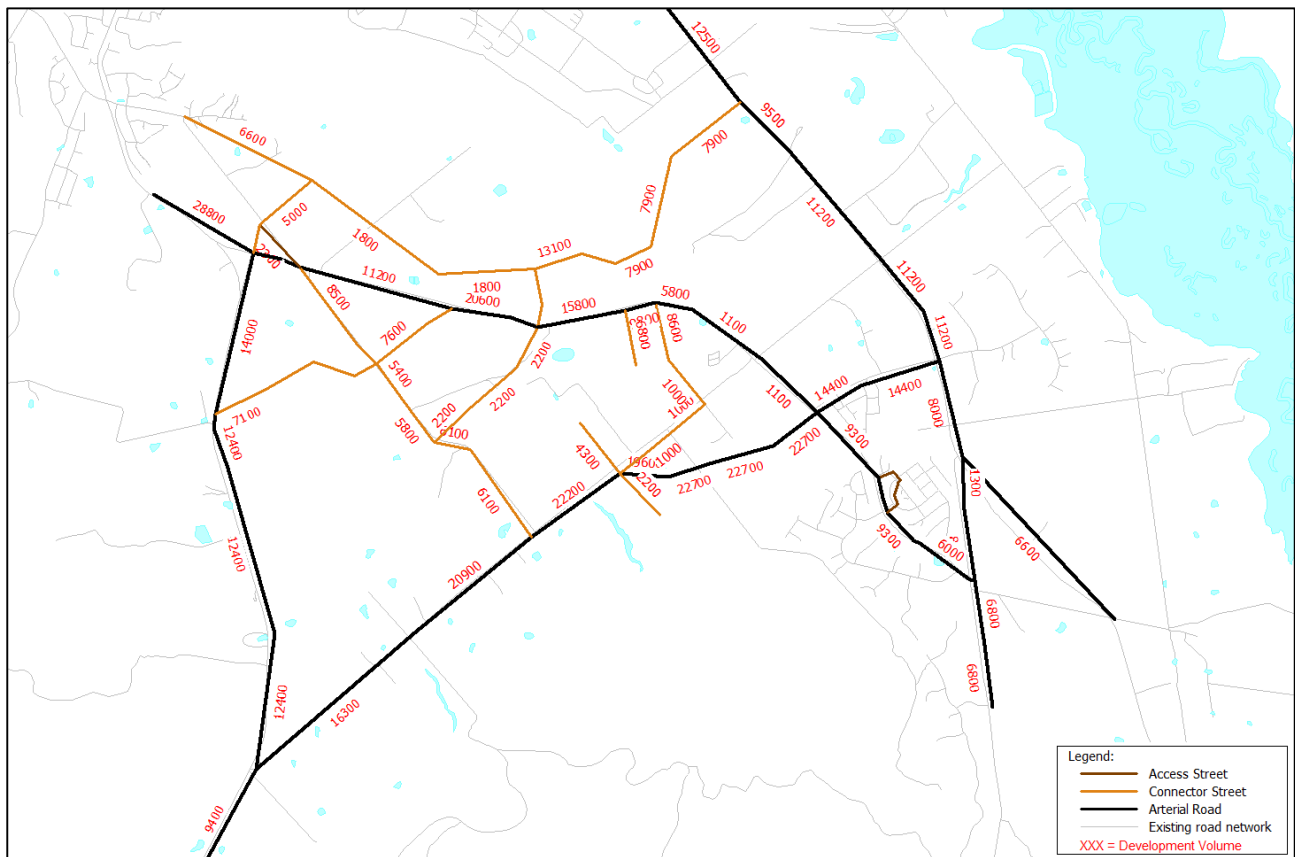

7.2.1 2026 Background Traffic Volumes

The expected 2026 daily background traffic volumes are outlined in Figure 7-1, with an enlarged copy included in Appendix E.

7.2.2 2026 Growth Area Generated Traffic Volumes

The anticipated daily traffic volumes generated by the 75% development of the Leneva-Baranduda Growth Area are outlined in Figure 7-2, with an enlarged copy included in Appendix E.

Figure 7-2 2026 Growth Area Generated Traffic Volumes

As outlined in Figure 7-2, the daily traffic volumes generated by the interim development of the Growth Area are expected to result in a number of internal roads carrying traffic volumes greater than that reflective of Connector Streets (i.e. a maximum of 6,000 vehicles per day), however the volumes are still within the Austroads capacity for a two-way two-lane road.

7.2.3 2026 Post-Development Traffic Volumes

The anticipated interim post-development daily traffic volumes are outlined in Figure 7-3, with an enlarged copy included in Appendix E.

Figure 7-3 2026 Interim Post-Development Daily Traffic Volumes

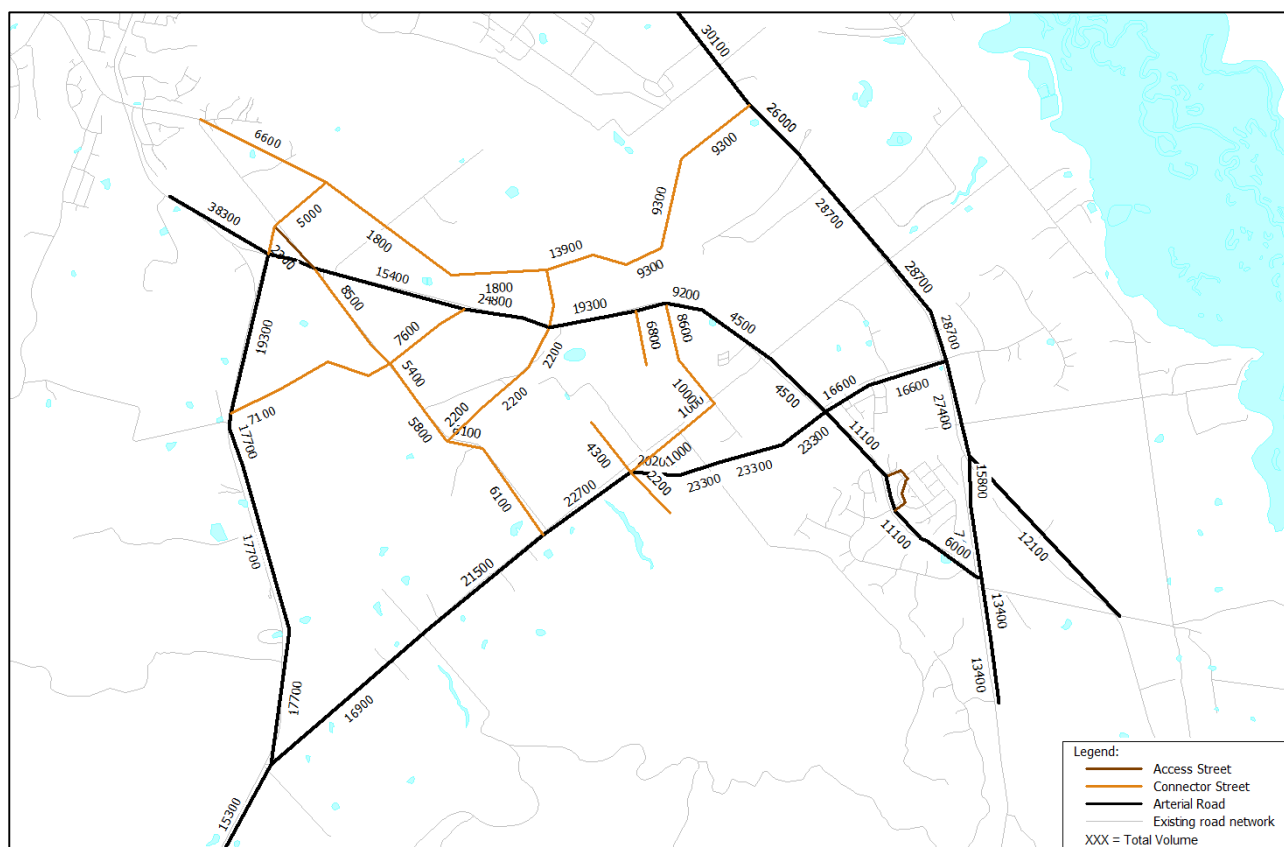

Figure 7-3 indicates the following:

- Beechworth-Wodonga Road is expected to carry volumes reflective of a Secondary Arterial Road in accordance with the MPA Road Classifications and Capacities. The volumes are however expected to be less than 18,000 vehicles per day, the Austroads specified capacity of a two-way, two-lane road.
- Volumes on Baranduda Boulevard increase in the vicinity of the Activity Centre / 9 hectare Council owned land parcel as a result of the concentration of activity in this area.
- Baranduda Boulevard is generally expected to carry volumes reflective of a Secondary Arterial Road (two-way, four-lane) in accordance with the MPA Road Classifications and Capacities and the Austroads theoretical capacities to the north of the LTC as a result of road connections to residential areas and other non-residential traffic generators (e.g. the LTC and the adjacent 9 hectare Council owned land parcel) within the Growth Area. To the south of the LTC, the expected volumes on Baranduda Road could be catered for by a two-way two-lane road as the expected volumes are within the Austroads theoretical capacity for a two-way two-lane road.
- Kiewa Valley Highway is expected to carry traffic volumes reflective of a Secondary Arterial Road (two-way, four-lane).
- Boyes Road is generally expected to carry volumes reflective of a Secondary Arterial Road (two-way, four-lane) in accordance with the MPA Road Classifications and Capacities and the Austroads theoretical capacities.
- Some section of Frederic Street Road, will carry volumes reflective of Boulevard Connector (i.e. up to 10,000 vehicles per day) as envisaged by the draft Future Urban Structure for the PSP area. Whilst greater than the upper limit for a Connector Street (6,000 vehicles per day) as specified in the Local Government's Infrastructure Design Association's Infrastructure Design Manual (IDM), it is noted that the volumes are within the Austroads theoretical capacity for a two-way two-lane road and can be catered for by a Boulevard Connector Street, with additional capacity provisions at intersections.
- The north-south Connector Streets in the vicinity of the Activity Centre carries volumes reflective of a higher order Connector Street near Baranduda Boulevard as a result of the connection it forms to the 9 hectare Council land parcel. A "Main Street" Connector Street could be provided in the vicinity of the LTC with additional capacity provided near the intersection with Baranduda Boulevard.

-
- 23

Figure 7-5 PM 1-Hour Peak Turning Volumes Year 2026

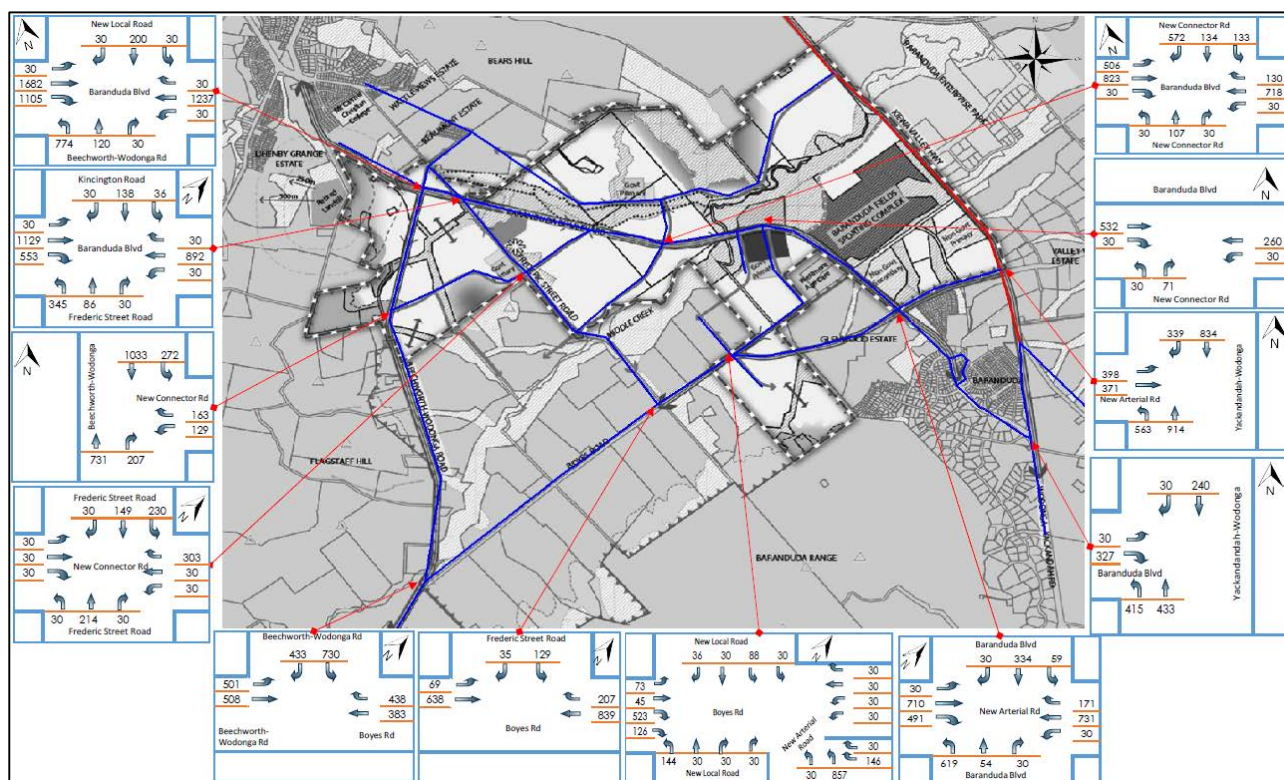

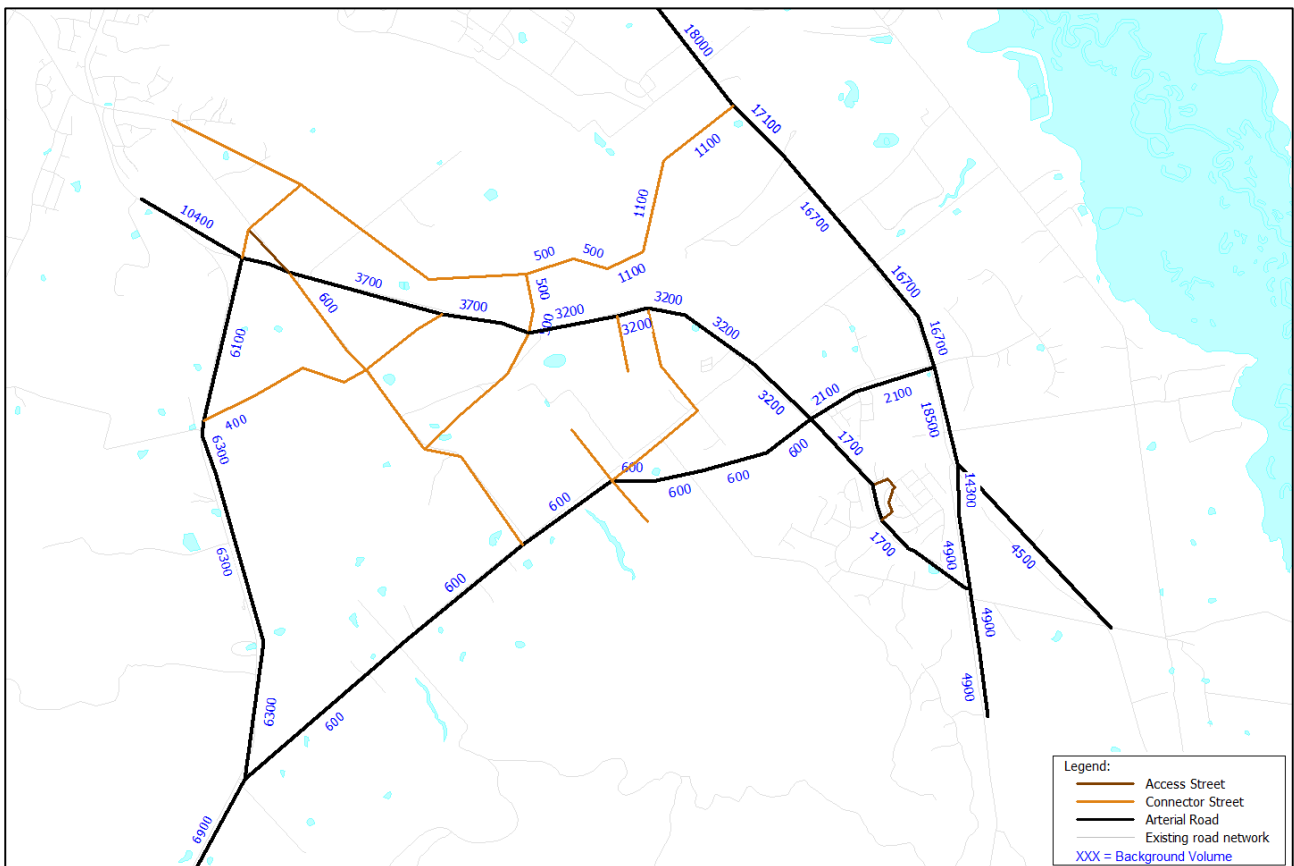

Figure 7-4 indicates that the Council owned 9 hectare development parcel (which is envisaged to provide for some 1,800 jobs), LTC and the secondary school within the PSP area, are expected to attract vehicle trips (employment and educational) from areas to the north of the study area. This results in the southbound traffic flows on Baranduda Boulevard (away from Wodonga) being greater than the northbound traffic flows (towards Wodonga) during the morning peak hour. Figure 7-5 indicates that the through traffic volumes on Baranduda Boulevard are expected to be more balanced in the PM peak as a result of the afternoon school peak and evening commuter peak not overlapping as is the case in the morning peak hour.

7.4 Ultimate (2046) Traffic Volume Assessment

7.4.1 2046 Background Traffic Volumes

The 2046 daily background traffic volumes are outlined in Figure 7-6, with an enlarged copy included in Appendix F.

Figure 7-6 2046 Daily Background Traffic Volumes

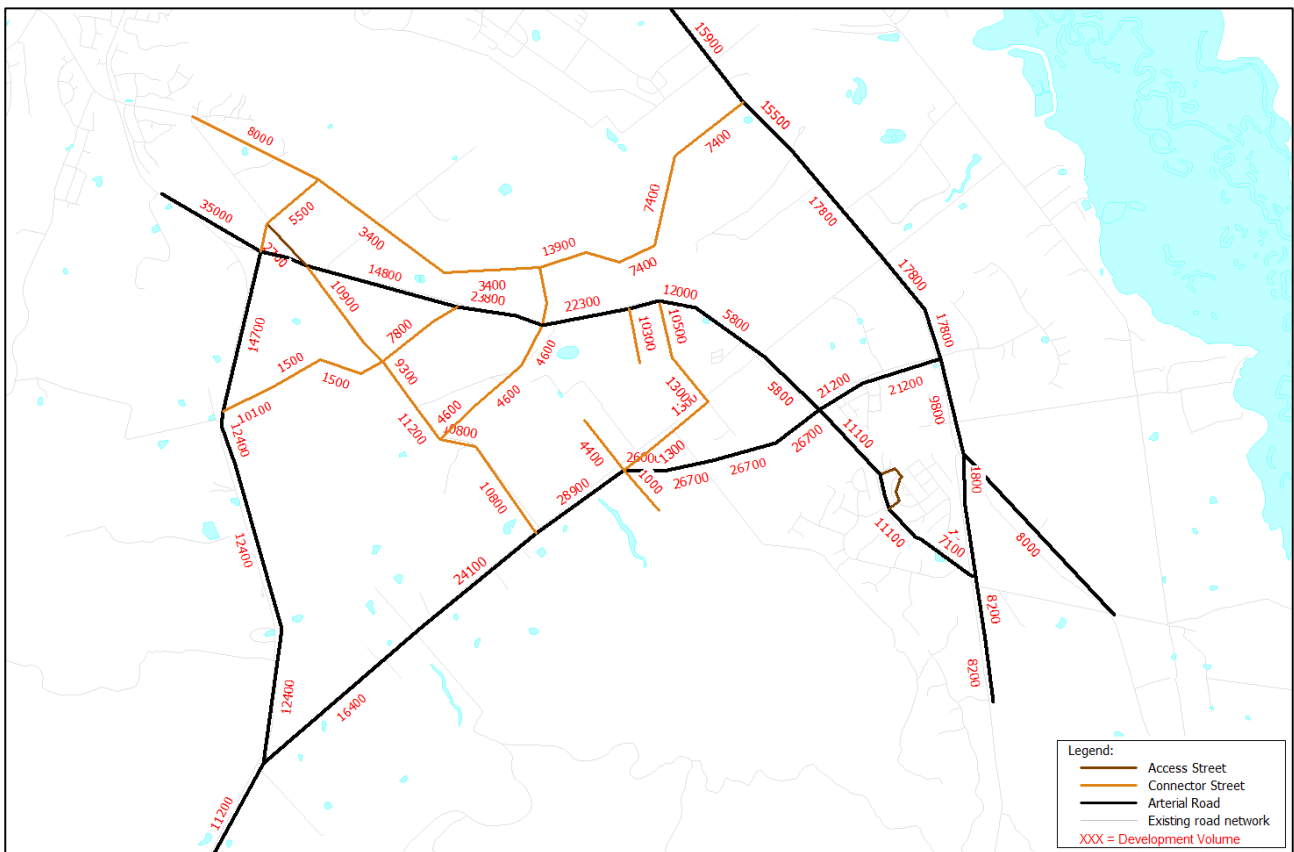

By 2046 the background traffic volumes on Kiewa Valley Road are expected to be nearing the upper Austroads capacity limit for a two-way, two-lane road indicating that it will require duplication even without the development of the Leneva-Baranduda Growth Area.

7.4.2 2046 Growth Area Generated Traffic Volumes

The anticipated daily traffic volumes generated by the full development of the Leneva-Baranduda Growth Area are outlined in Figure 7-7, with an enlarged copy included in Appendix F.

Figure 7-7 2046 Growth Area Generated Daily Traffic Volumes

Under ultimate conditions the Leneva-Baranduda Growth Area is expected to be fully developed. The volumes generated by the full development of the Growth Area will result in traffic volumes on Boyes Road, Baranduda Boulevard and Beechworth-Wodonga Road being reflective of a Secondary Arterial Road (two-way, four-lane roads).

7.4.3 2046 Post-Development Traffic Volumes

The anticipated ultimate post-development daily traffic volumes are outlined in Figure 7-8, with an enlarged copy included in Appendix F.

Figure 7-8 2046 Ultimate Post-Development Daily Traffic Volumes

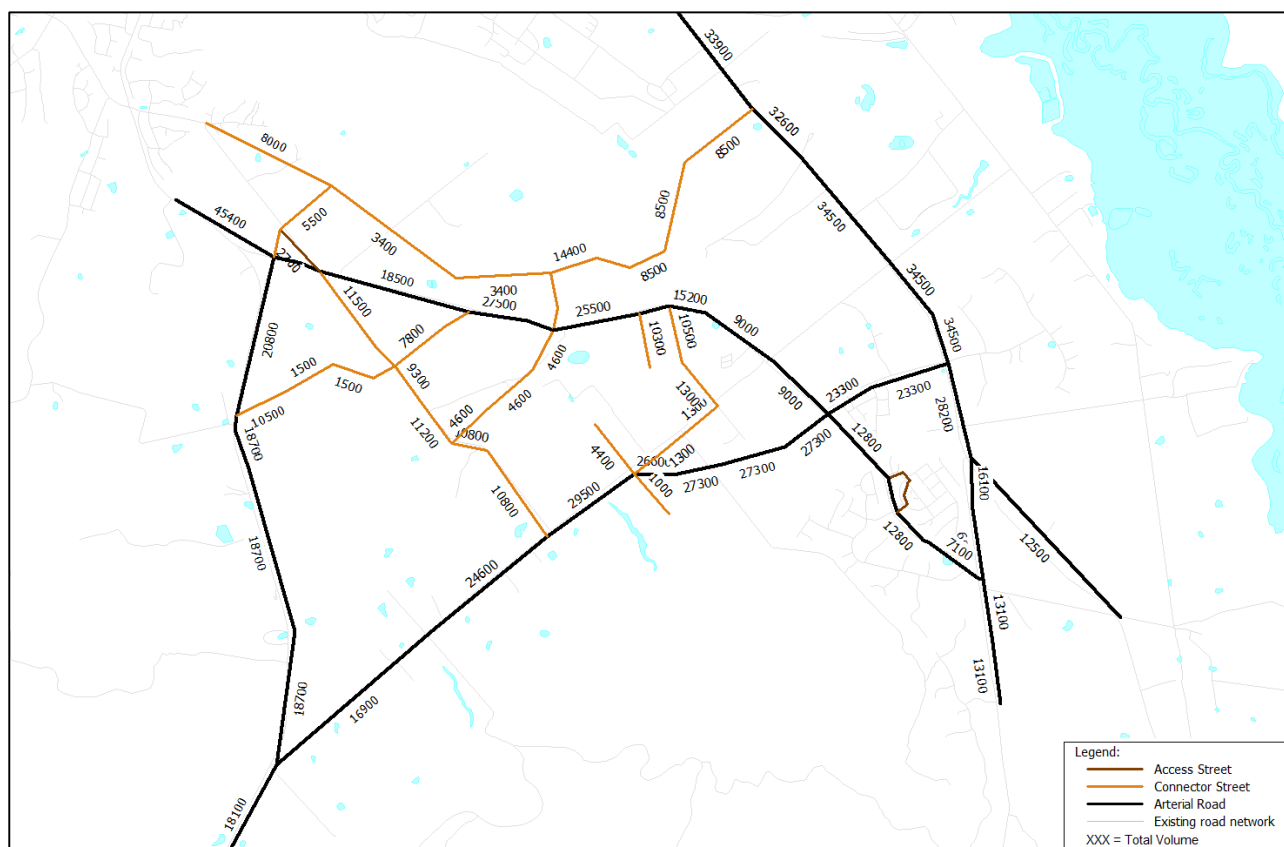

Figure 7-8 indicates that in addition to the interim findings the following are also anticipated under the ultimate conditions:

- Volumes on Fredric Street Road are reflective of a Secondary Arterial Road indicating a strong need of an additional north-south Connector Street between Frederic Street Road and Beechworth-Wodonga Road.
- Beechworth-Wodonga Road is expected to carry volumes reflective of a Secondary Arterial Road in accordance with the MPA Road Classifications and Capacities. The volumes are also expected to be slightly greater than 18,000 vehicles per day, the Austroads specified capacity of a two-way two-lane road indicating that consideration should be given to upgrading the road to a two-way four-lane road.
- Baranduda Boulevard is generally expected to carry volumes reflective of a Secondary Arterial Road (two-way, four-lane) in accordance with the MPA Road Classifications and Capacities and the Austroads theoretical capacities to the north of the LTC as a result of road connections to residential areas and other non-residential traffic generators (e.g. the LTC and the adjacent 9 hectare Council owned land parcel) within the Growth Area. To the south of the LTC, the expected volumes on Baranduda Road could still be catered for by a two-way two-lane road as the expected volumes are within the Austroads theoretical capacity for a two-way two-lane road.

7.5 Ultimate (2046) Peak Hour Turning Volumes

Turning volumes at key intersection for the 1 hour AM and PM commuter peaks have been extracted from the spreadsheet model and are shown in Figure 7-9 and Figure 7-10 respectively with enlarge copies provided in Appendix G.

[illegible]

Figure 7-9 indicates that the Council owned 9 hectare development parcel (which is envisaged to provide for some 1,800 jobs), the LTC and the secondary school within the PSP area are expected to attract vehicle trips (employment and educational) from areas to the north of the study area. This results in the southbound traffic flows on Baranduda Boulevard (away from Wodonga) being greater than the northbound traffic flows (towards Wodonga) during the morning peak hour. Figure 7-10 indicates that the through traffic volumes on Baranduda Boulevard are expected to be more balanced in the PM peak as a result of the afternoon school peak and evening commuter peak not overlapping as is the case in the morning peak hour.

8 Road Network Assessment

8.1 Overview

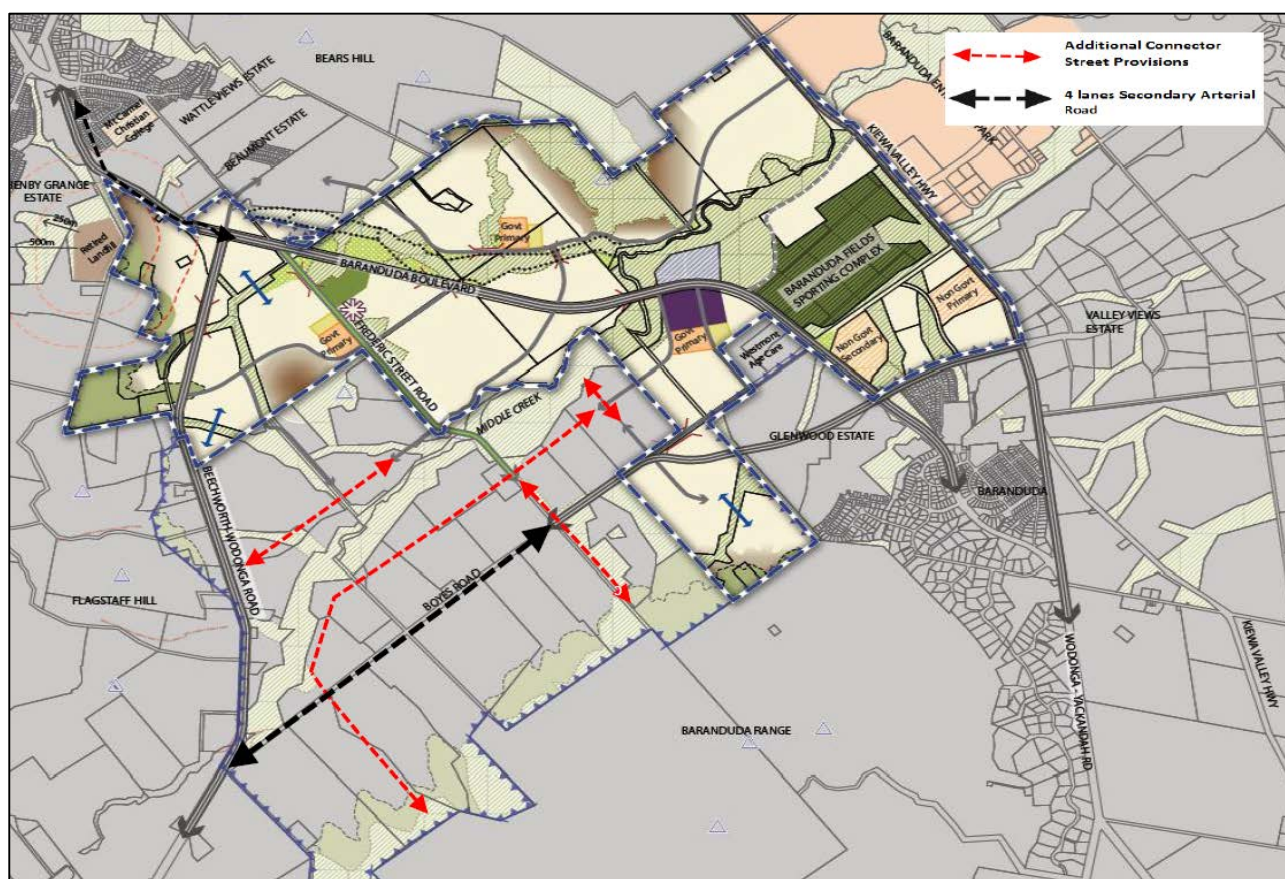

Based on the findings of the daily traffic modelling outlined in Section 7 and a review of the road network envisaged by the draft Future Urban Structure the interim and ultimate road network requirements were assessed with the findings outlined in the following sub sections.

It is highlighted that the constrained nature of the site, due to the irregular shape of the Growth Area, the existing locations of Arterial Roads, Middle Creek and the Wodonga Retained Environmental Network result in difficulties in terms of delivering a typical grid road network with a 1.6km grid for Arterial Roads and a supporting 800m grid network for Connector Streets.

8.2 Interim Road Network Requirements

Based on the findings of the interim analysis, the interim road network requirements for the Growth Area are outlined in Figure 8-1.

Figure 8-1 Interim Road Network Requirements

As outlined in Figure 8-1, a number of additional Connector Street connections will be required to ensure the traffic generated by the Growth Area can be accommodated.

The provision of additional east-west Connector Streets to the north of Boyes Road will also result in increased connectivity to the LTC activity area and relive pressure on the northern-most east-west Connector Street shown in the draft Future Urban Structure.

Daily traffic volumes on the LTC north-south Connector Streets are expected to be higher than the IDM specified capacity of 6,000 vehicles per day near Baranduda Boulevard as a result of the connection they form to the 9 hectare Council land parcel. The volumes through the LTC can however still be adequately catered for by a single lane in each direction (with additional capacity to be provided at intersections as required). Furthermore the provision of Connector Streets in this location will assist in slowing traffic speeds

and thereby allowing for enhanced pedestrian amenity which is essential given the activity centre and school land uses in this area.

In addition, to the north of the LTC, Baranduda Boulevard is generally expected to carry volumes reflective of a Secondary Arterial Road (as a result of new road connections to Baranduda Boulevard within the Growth Area) in accordance with the MPA Road Classifications and Capacities and the Austroads theoretical capacities. To the south of the LTC, the expected volumes on Baranduda Road could be catered for by a two-way two-lane road given that the expected volumes are within the Austroads theoretical capacity for a two-way two-lane road.

Boyes Road is also expected to carry volumes reflective of a Secondary Arterial Road (two-way, four-lane) in accordance with the MPA Road Classifications and Capacities and the Austroads theoretical capacities.

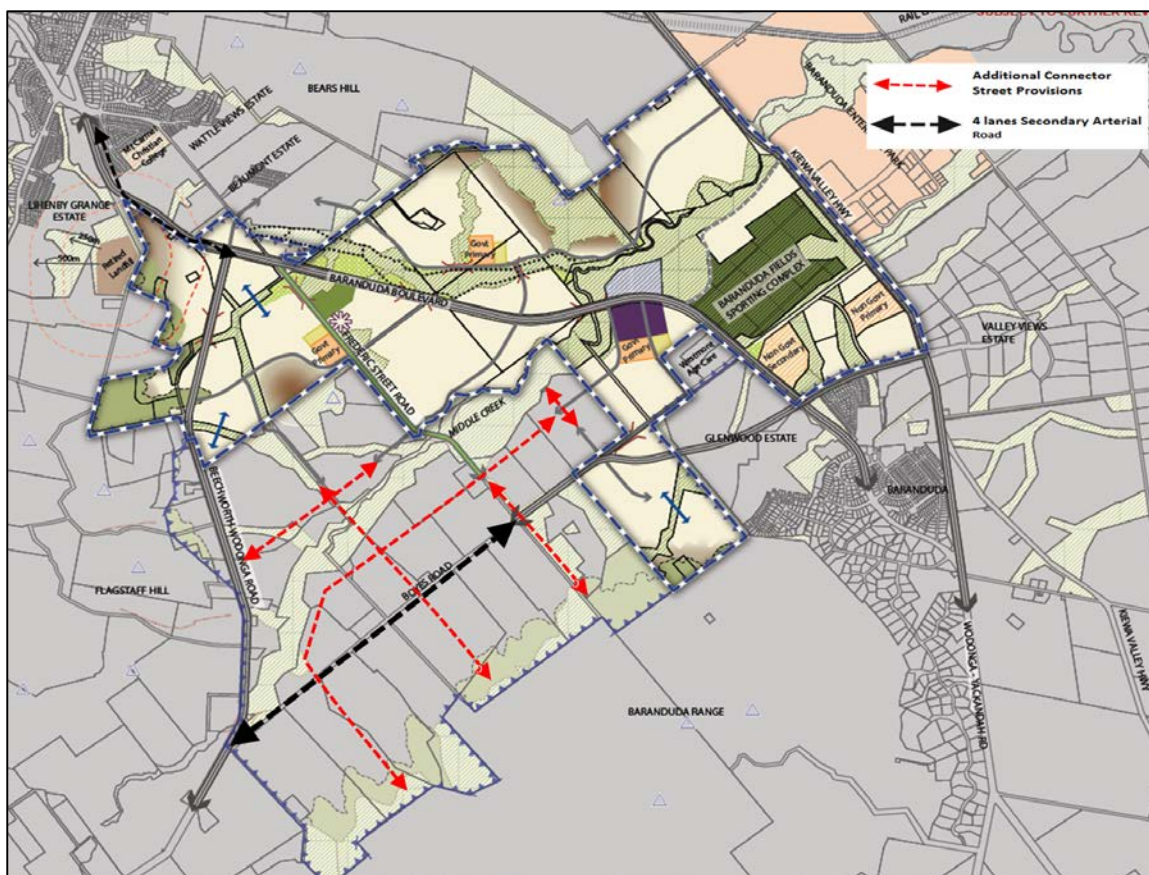

In addition it is noted that Beechworth-Wodonga Road is expected to carry volumes reflective of a Secondary Arterial Road in accordance with the MPA Road Classifications and Capacities. The volumes are however expected to be less than 18,000 vehicles per day, the Austroads specified capacity of a two-way, two-lane road indicating that the provision of a two-way two-lane road is suffice under interim conditions.

Finally it is noted that the modelling shows that Kiewa Valley Highway is expected to carry traffic volumes reflective of a Secondary Arterial Road (two-way, four-lane) indicating that consideration should be given to upgrading the road in the interim.

8.3 Ultimate Road Network Requirements

Based on the findings of the ultimate analysis, the ultimate road network requirements are outlined in Figure 8-2.

Figure 8-2 Ultimate Road Network Requirements

In addition to the identified additional interim road network requirements, Figure 8-2 shows that an additional north-south Connector Street will be required between Beechworth-Wodonga Road and Frederick Street Road to adequately cater for the anticipated ultimate traffic volumes. This additional north-south Connector

Street provision will result in Frederick Street Road carrying volumes more reflective of a Connector Street rather than a Secondary Arterial Road.

Furthermore, Beechworth-Wodonga Road is expected to carry volumes reflective of a Secondary Arterial Road in accordance with the MPA Road Classifications and Capacities and the Austroads theoretical capacities indicating that consideration should be given to upgrading the road to a two-way four-lane road.

9 Conclusions

This report addresses the land use inputs, the associated traffic demand and resulting road network requirements for the Leneva-Baranduda PSP (PSP1105) and the wider Leneva-Baranduda Growth Area for the interim and ultimate development scenarios.

Based on the analysis and discussions presented with this report the following conclusions are made:

General

- The Leneva-Baranduda PSP (PSP1105) is ultimately anticipated to generate some 82,490 daily vehicle movements (inclusive of some 20,620 internal trips).
- The entire Leneva-Baranduda Growth area is ultimately anticipated to generate some 141,820 daily vehicle movements (inclusive of some 35,460 internal trips).
- The road network outlined in the draft Future Urban Structure provides suitable road network connections for the development of the Leneva – Baranduda PSP area, however additional north-south and east-west Connector Street provisions will be required within the wider Growth Area.

Interim Road Network Considerations

- The interim analysis indicates that Baranduda Boulevard, to the north of the LTC, is generally expected to carry volumes reflective of a Secondary Arterial Road (two-way, four-lane) in accordance with the MPA Road Classifications and Capacities and the Austroads theoretical capacities (as a result of new road connections to Baranduda Boulevard within the Growth Area). To the south of the LTC, the expected volumes on Baranduda Road could be catered for by a two-way two-lane road given that the expected volumes are within the Austroads theoretical capacity for a two-way two-lane road.
- The interim analysis also indicates that Boyes Road is expected to carry volumes reflective of a Secondary Arterial Road (two-way, four-lane) in accordance with the MPA Road Classifications and Capacities and the Austroads theoretical capacities.
- Beechworth-Wodonga Road is expected to carry volumes reflective of a Secondary Arterial Road (two-way, four-lane) in accordance with the MPA Road Classifications and Capacities. The volumes are however expected to be less than 18,000 vehicles per day, the Austroads specified capacity of a two-way, two-lane road indicating that the provision of a two-way two-lane road is suffice under interim conditions.
- The interim modelling shows that Kiewa Valley Highway is expected to carry traffic volumes reflective of a Secondary Arterial Road (two-way, four-lane) indicating that consideration should be given to upgrading the road in the interim.
- A number of additional Connector Street connections will be required to ensure the traffic generated by the wider Growth Area can be accommodated. The provision of additional east-west Connector Streets to the north of Boyes Road will also result in increased connectivity to the LTC activity area and relive pressure on the northern-most east-west Connector Street shown in the draft Future Urban Structure.

Ultimate Road Network Considerations

- In addition to the interim road network requirements, the ultimate scenario modelling indicates that Beechworth-Wodonga Road is expected to carry volumes reflective of a Secondary Arterial Road (two-way, four-lane) in accordance with the MPA Road Classifications and Capacities and the Austroads theoretical capacities indicating that consideration should be given to upgrading the road to a two-way four-lane road under ultimate conditions.
- An additional north-south Connector Street provision between Beechworth-Wodonga Road and Frederick Street Road will also be required within the Growth Area and will result in Frederick Street Road carrying volumes more reflective of a Connector Street rather than a Secondary Arterial Road.

Traffic Data

A1 Traffic Count Data from Council

The City of Wodonga provided Cardno with Metrocount survey data, sourced from surveys undertaken between February 2015 and May 2015. The summary of survey data is provided in Table A1.

Table A1: City Council Metrocount Survey Data

No	Road Name	AM Peak (2hr)	PM Peak (2hr)	Daily
1	Baranduda Blvd east of Beechworth WB	415	278	1,513
	Baranduda Blvd east of Beechworth EB	195	310	1,393
2	Baranduda Blvd north of Boyes Road WB	298	256	1,361

A2 Origin Destination Data from WANS

The traffic survey data was also extracted from Origin-Destination (O-D) survey data collected as part of the Wodonga Arterial Network Study. The locations of the count stations is shown in Figure A1 and the results of the O-D surveys for the AM and PM peaks are shown in Table A2 and Table A3 respectively.

Figure A1: WANS O-D Survey Station Location

A3 Cardno Data Collection

Cardno also commissioned AM and PM peak hour turning movement counts and weekly tube count surveys within the local study area in June 2015 to gain an understanding of current traffic characteristics of the area. The location of the surveys is presented in Figure A2, with the results summarised in Table A4.

Figure A1: Traffic Survey Locations

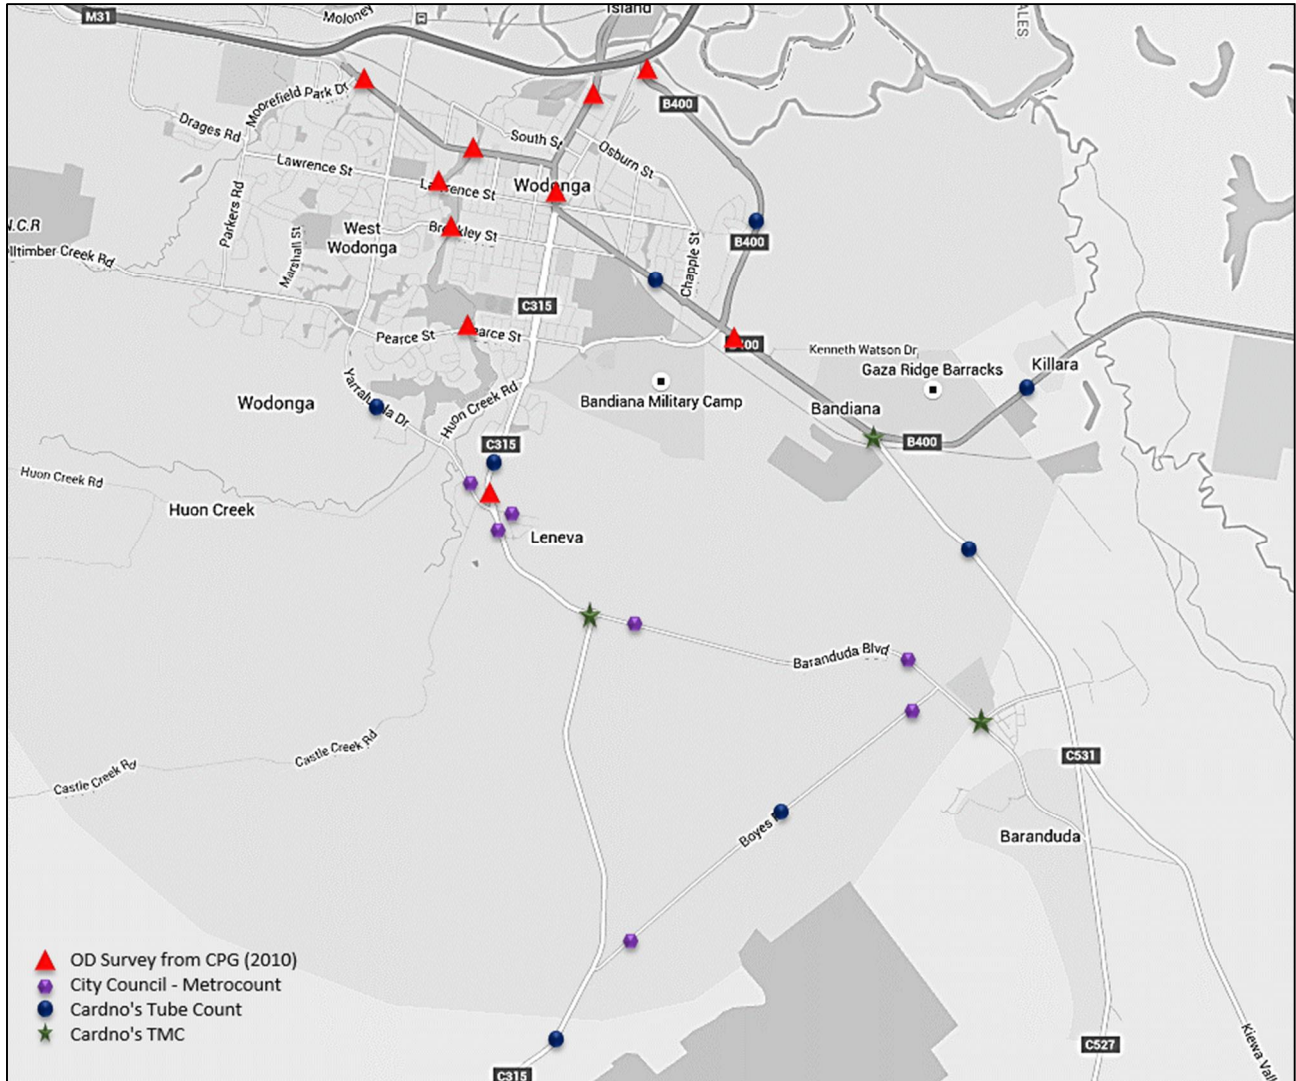

Table A4 Cardno Traffic Counts (TMC and Tube Count)

No	Location Description (Direction)	AM (2hr)	PM (2hr)	Daily	Note

C

SVITM VALIDATION

Strategic Model Validation

B1 Overview

B1.1 Model Valuation Procedure

Model validation is a process in which the model inputs are adjusted to reflect actual network characteristics to allow the strategic model to produce travel demands in line with actual measured traffic conditions.

Existing traffic counts are used as a reference point to compare against modelled link volumes after each model assignment run. Following any link adjustments the model demands are once again assigned and modelled, and the results are again compared to the surveyed traffic count data. This process is repeated until the model results converge to a point where they meet certain validation criteria.

Given the scale of strategic models (noting that State-wide Victorian Integrated Transport Model encompasses almost all of Victoria), strategic network models are generally calibrated to reflect existing traffic counts across a large corridor or region, and are not expected to accurately match traffic counts at individual locations. To achieve the model validation, the model is measured by comparing counts across a number of locations, such as along screen lines.

B1.2 Model Validation Guidelines

Model calibration and validation guidelines have been developed by VicRoads for use on strategic modelling projects, these guidelines are outlined in the VicRoads document '*Transport Modelling Guidelines, Volume 2: Strategic Modelling*', dated April 2012. This document outlines the model validation targets for VITM modelled traffic volumes. Three key criteria are prescribed by VicRoads to assess the suitability of the base model. The VicRoads criteria are discussed further in the following Section.

B2 Model Validation Criteria

B2.1 VicRoads Validation Criteria - Overview

The VicRoads guidelines for the validation of strategic models require three main criteria to be met. The criteria includes the calculation of the Percent Root Mean Square Error (%RMSE), Scatter plots showing the slope of best-fit regression line, and the Coefficient of Determination (R^2).

B2.2 Root Mean Squared Error

The Percentage Root Mean Squared Error (%RMSE) is an indication of the correlation between modelled and surveyed traffic volumes. It is noted the %RMSE is dependent on the size of the count volume. %RMSE is ideal for use during the validation process of a strategic model as it emphasises counts with high volumes that need to be validated accurately. It is expressed as:

$$\%RMSE = 100N \frac{\sqrt{\frac{\sum (M-C)^2}{(N-1)}}}{\sum C}$$

Where:

%RMSE is the percentage root mean squared error

N is the number of count/modelled link pairs

\sum is the summation of count/modelled link pair 1 to N

M is the modelled one-way link volume (peak period)

C is the measured average one-way link volume (peak period)

The VicRoads criteria for the validation of strategic models states that the overall %RMSE should be below 30%.

B2.3 Scatter Plots

Scatter plots plot surveyed and modelled traffic volumes for roads within the study area. Plots are required for each time period modelled. Based on these scatter plots two indicators can be produced, the slope of best fit and the R^2 value.

Coefficient of Determination (R^2)

The Coefficient of Determination (R^2) is used in the validation process as it is a measure of the correlation between modelled flows and count volumes in the form of a linear trend line. Although the R^2 value is an efficient means of expressing correlation between two sets of data, it is not sufficient to use the R^2 as the only method of validation as it is possible for the modelled flows to be well above or below measured counts and still produce a strong linear correlation. The R^2 value is defined as:

$$R^2 = \frac{\sum(C - \bar{C})(M - \bar{M})}{\sqrt{\sum(C - \bar{C})^2 \sum(M - \bar{M})^2}}$$

Where:

r is the Coefficient of Determination (R-Squared)

\sum is the summation of count/modelled link pairs

M is the modelled one-way link volume (peak period)

C is the measured average one-way link volume (peak period)

The industry standard R-squared target for strategic models is a value above 0.88, however most of guidelines state that models should be validated to have an R-Squared value above 0.90.

Slope of Best Fit

The slope of best-fit regression line is an overall measure of model performance. The validation criteria require that the gradient of the trend line be between 0.9 and 1.1 while restricted to passing through the graph origin.

GEH Statistic

The GEH statistic is an alternative measure to the scatter plot as a means of comparing surveyed and modelled traffic volumes.

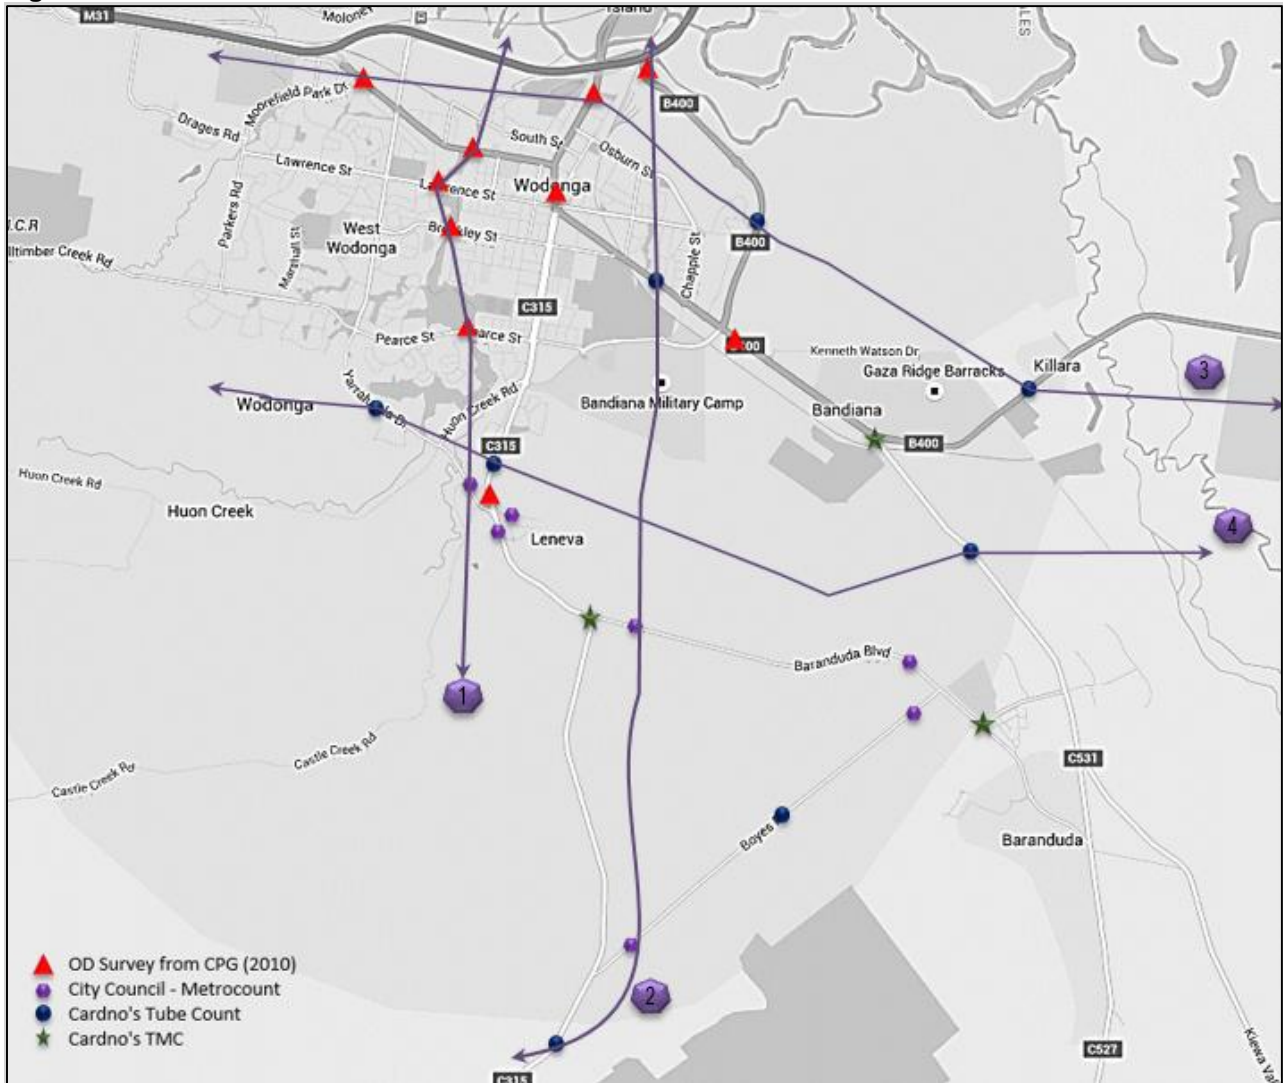

The VicRoads criteria notes that if the validation criteria for scatter plots are not marginally met, the GEH statistic should be used for model validation. VicRoads targets for applying GEH statistic are 50% of cases must have GEH <5, and 80% of cases to have GEH <10.

B3 Model Validation Results

B3.1 Screen Line Locations

As previously outlined, strategic models are generally validated to reflect a wide corridor or regional area, and are not validated to accurately match traffic count data at all individual locations in the modelled area, instead validation is typically measured by comparing traffic counts across a number of locations such as a screen lines. For the purposes of this study the screen lines adopted for validation purposes are shown in Figure B1.

Figure B1: Screen Line Location

Based on the above outlined, the observed and modelled traffic count data is summarised in Table B1:

Table B1: Screen Line Data: Modelled verses Surveyed

Screen Line	AM Observed	AM Modelled	PM Observed	PM Modelled
1	360	291	383	347
1	831	908	984	1,043
1	1,256	1,262	762	769
1	913	922	544	552
1	1,231	1,319	831	904
1	339	307	376	308
2	44	35	22	25
2	1,061	891	1,080	890
2	210	250	293	317
2	672	713	999	1,030
2	21	26	31	26
2	309	344	244	290
3	1,804	1,475	1,919	1,558
3	1,218	1,381	1,138	1,272
3	674	650	630	653
3	1,445	1,473	1,927	1,953
3	572	661	852	930
3	1,729	1,844	1,873	1,975
4	442	534	1,071	1,078
4	726	846	488	489
4	1,075	1,226	573	677
4	644	661	491	505
4	350	366	658	671
4	397	361	809	747

B3.2 Scatter Plots

The scatter plots for all the screen line locations AM and PM peaks are shown in Figure B2 and Figure B3 respectively.

Figure B2: AM Peak Scatter Plot

Figure B3: PM Peak Scatter Plot

Figure B2 and Figure B3 show that the scatter plots for all the screen line locations accord with the VicRoads criteria.

The screen lines were also assessed on an individual basis with the results of the analysis summarised in Table B2:

Table B2: Screen Line Validation Results

Screen Line (SL)	AM					PM				
	%RMS E	Slope	R ²	GEH<5	GEH<10	%RMS E	Slope	R ²	GEH<5	GEH<10
Requirement	>30%	0.9 – 1.1	0.9 – 1.1	<50%	<80%	>30%	0.9 – 1.1	0.9 – 1.1	<50%	<80%
SL – 1	8	1.03	0.99	100%	100%	8	1.03	0.97	100%	100%
SL – 2	21	0.92	0.96	100%	100%	20	0.93	0.97	100%	100%
SL – 3	14	0.99	0.87	83%	100%	13	0.98	0.89	83%	100%
SL – 4	16	1.11	0.97	100%	100%	8	1.01	0.97	100%	100%
Overall	23	1.06	0.94	93%	98%	21	1.05	0.95	93%	98%

As highlighted in Table B2 screen line 3 (AM and PM peak), and screen line 4 (AM peak) are marginally outside the VicRoads criteria in some cases, accordingly the GEH statistic is also reported in Table B2. The GEH results outlined in Table B2 indicate that both the AM and PM peak period models are appropriately validated.

B2.3 Root Mean Squared Error

The results of the %RMSE validation for each screen line are also shown in Table B2 which indicates that the %RMSE for each screen line meet the relevant VicRoads criteria for both peak periods.

B4 Summary

The validation results demonstrate that both the AM and PM peak SVITM models meet the relevant VicRoads criteria, the Cardno refined base case SVITM models are considered to be fit for purpose in terms of assessing future year background traffic volumes and distributions for this study.
