1. EXECUTIVE SUMMARY

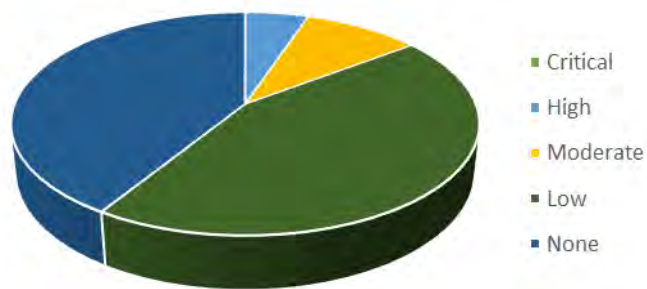

The Victorian Planning Authority (VPA) have engaged ENSPEC to undertake an arboriculture assessment of trees on and around the land within the Casey Fields South precinct of the Casey Fields South and Devon Meadows Precinct Structure Plan (PSP).

812 individual trees and 217 groups were assessed for a total of 5021 trees. Access to some properties could not be arranged. In these cases, as far as practical, the number and type of trees was assessed remotely from adjoining land (see Appendix 1). It is expected that the majority of trees within the PSP have been accounted for in the assessment although it is inevitable that some trees were not visible and are therefore not represented in the data.

Each tree or group has been given a retention rating based on its species, size, condition and location. A summary of the Retention rating for individual trees is provided in the following table.

Table 1

Retention	No of trees	% of total
Critical	2	0.0%
High	258	5.1%
Moderate	479	9.5%
Low	2217	44.2%
None	2065	41.1%
Grand Total	5021	100.0%

The PSP is currently zoned Urban Growth Zone (UGZ) and Clause 52.17 of the Planning Scheme (net gain provisions) will apply to the removal of any indigenous flora.

Existing tree canopy cover is low as expected given the current agriculture and horticulture use of the land. Exotic and native ornamental trees deliberately planted as shelterbelts, screening or for ornamental purposes are dominant. Tree canopy within the PSP is dominated by small mature trees with local landscape value only.

Council's vision focuses on industrial use for this PSP. Typically, tree canopy cover in industrial areas is extremely low. If development of the PSP proceeds along the typical model for such areas it is expected that most of the existing trees will be lost to the community.

No substantial patches of native vegetation remain although scattered remnant or regenerated indigenous specimens are present, a few of which have active or structural habitat value. Lacking substantive native vegetation patches limits the biodiversity value of the trees in the project area.

Enhancing biodiversity values and linkages is a key opportunity for the redevelopment of the project area, especially given the proximity of the Royal Botanic Gardens Cranbourne.

Adequate public land and wide road reserves will be essential if community expectations for tree canopy cover are to be met in this area, or to achieve any biodiversity value within the precinct. Where they are healthy and established, large trees should be targeted for preservation within public land as they will provide immediate enhancement to the redeveloped landscape.

The opportunity to create building setbacks and require green areas and tree canopy within the private land should be explored to improve the function, amenity and appeal of the area as a desirable place to work.

For any trees retained it will be essential to design the sites and provide adequate space to ensure their Structural Root Zones and 90% of their Tree Protection Zones are adequately protected as stipulated by AS4970-2009 *Protection of trees on development sites*.

Remedial maintenance recommendations have been provided for specific trees based on their retention and incorporation into development. These works are not necessary while the trees are part of the existing rural landscape, or if the trees are to be removed. Please see the accompanying data tables for work recommendations.

Any tree work must be carried out by appropriately qualified arborists working to AS4373-2007 *Pruning of amenity trees*, Minimum Industry Standard *MIS308 Tree pruning* and Minimum Industry Standard *MIS312 Environmental arboriculture*.

The key recommendations for the existing trees and providing good future function and amenity for the Casey Fields South and Devon Meadows PSP are provided below.

- Preserve and protect the 2 Critical Retention value and 258 High Retention value trees.
- Where practical preserve other existing trees that are in good condition.
- For any trees retained design the sites such that adequate space to ensure their Tree Protection Zones are adequately protected as stipulated by AS4970-2009 *Protection of trees on development sites*.
- Show trees to be retained and their Tree Protection Zones on all planning and design documentation to ensure adequate planning for their preservation and protection.
- Require strict adherence to AS4970 for trees to be retained and ensure this is requirement included in all documentation.
- Provide public land and wide road reserves with sufficient unpaved areas to accommodate **sufficient number and size of mature trees to meet Council's tree canopy cover and biodiversity goals**.
- Design drainage and water flow to enhance the growing environment for trees by ensuring adequate water permeability in the landscape.
- Require building setbacks, green areas and minimum tree canopy cover goals within private land to improve the function, amenity and appeal of the area as a desirable place to work.
- Enhance biodiversity values and linkages with the Royal Botanic Gardens Cranbourne by creating contiguous corridors of locally indigenous flora.

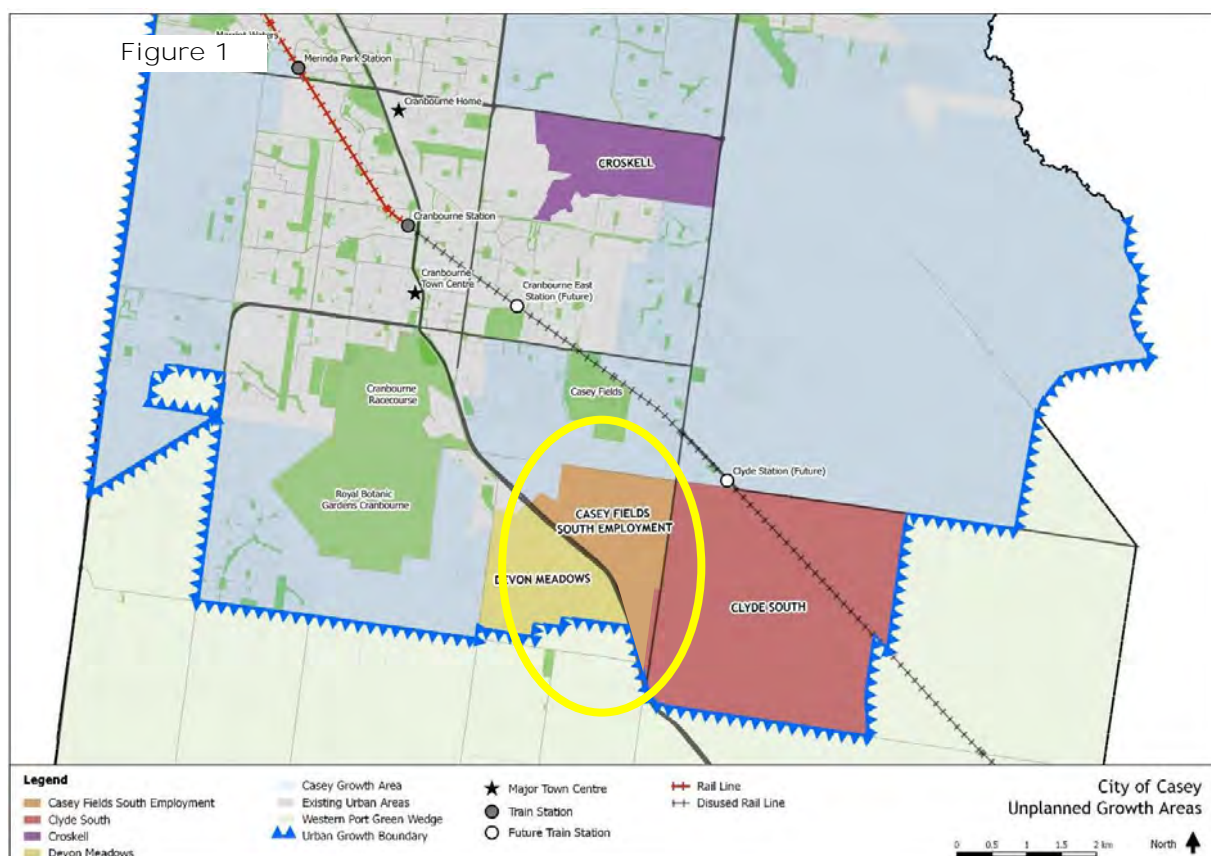

2. INTRODUCTION

The Victorian Planning Authority (VPA) is preparing an Amendment to the Casey Planning Scheme for the Casey Fields South and Devon Meadows Precinct Structure Plan (PSP) and Infrastructure Contributions Plan. The VPA will prepare these plans in consultation with the City of Casey, government agencies, service authorities, and landowners.

The Casey Fields South precinct of the PSP covers 275 hectares south of Ballarto Road and west of Clyde-Five Ways Road in Clyde and Cranbourne East and is identified as 'industrial' in the South East Growth Corridor Plan.

City of Casey - Vision for Casey Fields South Precinct

- The Casey Fields South Employment PSP will encourage industry and investment that builds on the nearby Casey Fields regional sporting facility, the Royal Botanic Gardens Cranbourne, the Cranbourne Racecourse and the Western Port Green Wedge. Complementary industry may include sports medicine, food manufacturing enterprises, education facilities and other value adding industries.
- The PSPs will require well-designed interfaces to adjoining residential areas (internal and external to the precincts) be created to minimise the potential impacts of industrial or employment-based land uses on residential amenity, and to allow for development of industries and associated uses that will be compatible with the nearby community.
- **South Gippsland Highway will become a key gateway into Casey's urban area.** Land use, development, tree planting and public artwork along South Gippsland Highway must contribute to this amenity and arrival experience.
- The pedestrian and cycling network should prioritise easy access to Casey Fields, Royal Botanic Gardens Cranbourne and the future Clyde Railway Station. Active travel can be maximised through improved amenity and boulevard treatments (such as wider paths and tree planting) along key roads and shared paths.
- Achieve best practice integrated water management within the Western Port Catchment and reduce the impact of stormwater on non-urban areas outside the Urban Growth Boundary.

3. BRIEF & INSPECTION METHODOLOGY

The Victorian Planning Authority (VPA) have engaged ENSPEC to undertake an arboriculture assessment of trees on and around private land within the Casey Fields South and Devon Meadows Precinct Structure Plan (PSP).

3.a. Scope

The scope of the assessment is to determine the health, type and integrity of the trees within the precinct. The assessment will also determine their arboriculture value, landscape value and their likelihood of survival in an urban environment.

Parcels and roadsides within the precincts (as well as roadsides adjacent to but outside the precincts) that have not previously been assessed will be required to be surveyed. If access is not possible then a visual assessment from the property boundary must be undertaken to obtain a basic understanding of the value of any visible trees.

The assessment must comprise a survey of all scattered trees within the precinct greater than 15cm in diameter at breast height (DBH).

3.b. Methodology

Site methodology involved a visual inspection each tree's present health and growing environment and recording of data electronically in the field. Groups of lower value trees, windrows or hedges were collected as groups. Higher value trees within groups are recorded individually.

Where accessible, the trunk diameter at breast height (DBH) and basal diameter for individually recorded were measured using a forestry tape measure for the calculation of the Tree Protection and Structural Root Zones in accordance with AS4970-2009 *Protection of trees on development sites*. To comply with native vegetation requirements, the DBH of each tree was measured at 1.3m above ground. This measurement is used for AS4970 calculations and is considered to make no material difference to the effectiveness of AS4970 zones. Other dimensions were visually estimated.

Access to some properties could not be arranged. In these cases, as far as practical, the number and type of trees was assessed remotely from adjoining land.

4. DATES OF ASSESSMENT

The trees were assessed between November 11th and 29th, 2022.

5. ARBORISTS CONDUCTING ASSESSMENT

Name of Arborist Hayden Egan-Connelly
 Qualifications Diploma of Arboriculture
 Quantified Tree Risk Assessment (QTRA) #6809

Name of Arborist Michele Dengo
 Qualifications Diploma of Arboriculture

6. OVERVIEW

The following figure shows an overview of the individual trees and groups assessed across the project site with labelling for groups and rows shown. Some areas of the site were not accessible and were not able to be assessed. There are also patches of shrubby vegetation visible on the aerial imagery that are outside the scope of the assessment. An A3 version and detail maps are provided in the appendices.

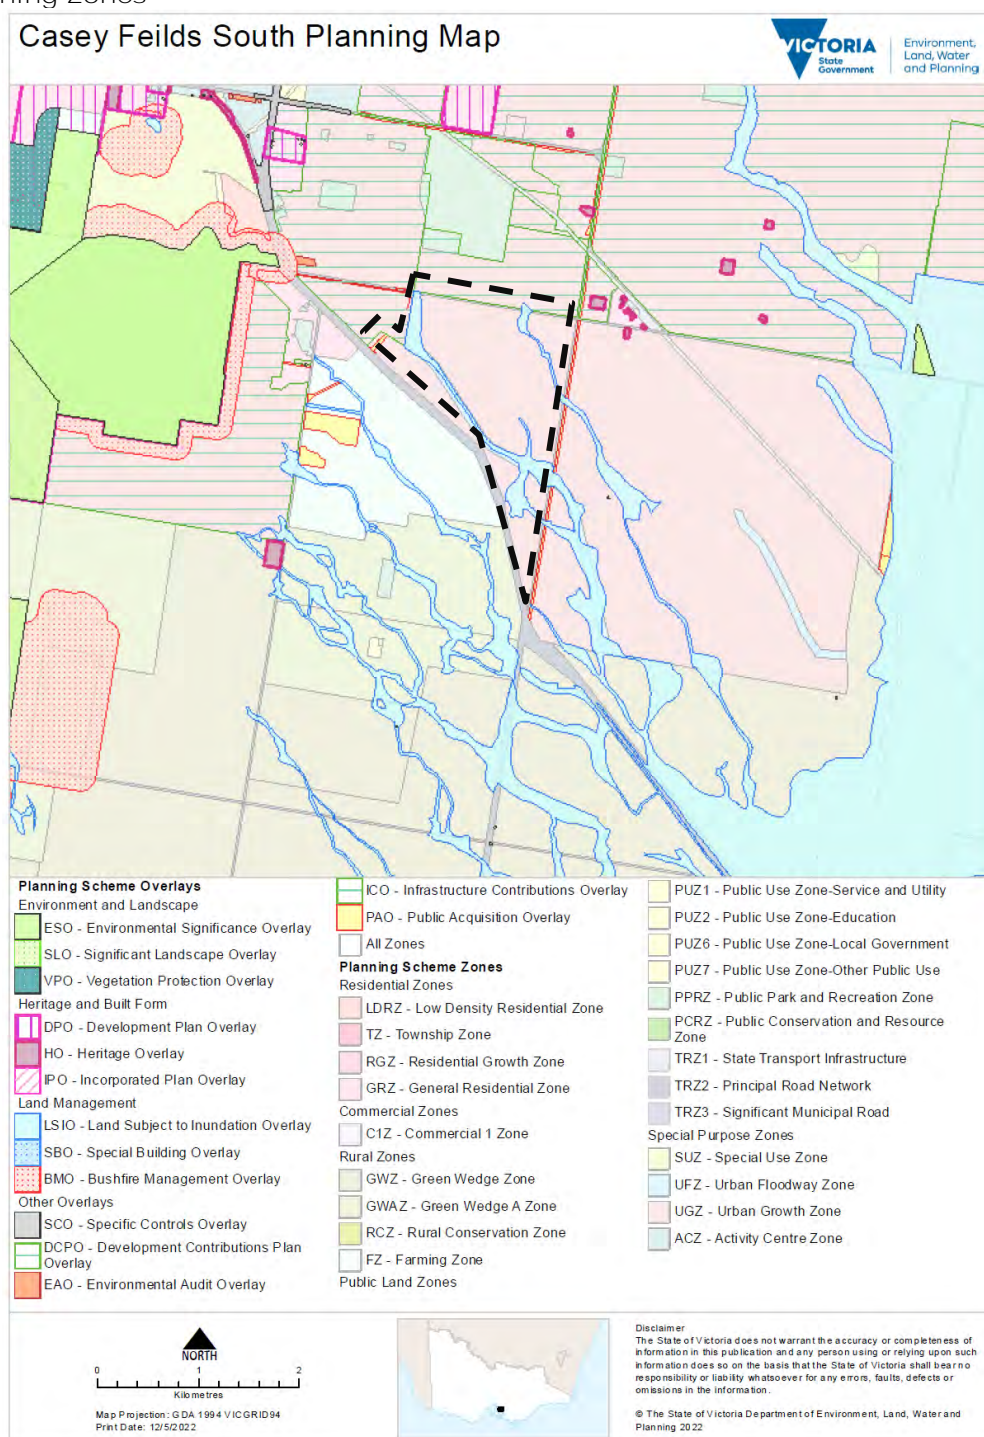

Figure 2 - Assessment overview

6.a. Relevant policy and legislation

The project area is zoned Urban Growth Zone (Figure 3).

Figure 3 - Planning Zones

Vicmap (2022)

Clause 52.17 of the Planning Scheme (net gain provisions) will apply to the removal of any indigenous flora.

The Land Subject to Inundation overlay (LSIO) applies to parts of the project area.

No other overlays are in effect on the land. A more detailed planning map is provided in the appendices.

7. TREE POPULATION SUMMARY

A summary of the general tree data for the surveyed population is provided in the following section. 812 individual trees and 217 groups were assessed, for a total of 5021 trees. For groups, factors such as life expectancy have been rated as a typical rating for individuals within the group although there will be variation within a given group.

Access to some properties could not be arranged. In these cases, as far as practical, the number and type of trees was assessed remotely from adjoining land.

7.a. Species

812 individual trees and 217 groups were assessed, for a total of 5021 trees.

Table 2

Species	Common name	No of trees	% of total
<i>Acacia dealbata</i>	Silver Wattle	11	0.2%
<i>Acacia elata</i>	Cedar Wattle	3	0.1%
<i>Acacia floribunda</i>	Gossamer Wattle	1	0.0%
<i>Acacia longifolia</i> ssp. <i>longifolia</i>	Sallow Wattle	2	0.0%
<i>Acacia mearnsii</i>	Black Wattle	4	0.1%
<i>Acacia melanoxylon</i>	Blackwood	37	0.7%
<i>Acacia pycnantha</i>	Golden Wattle	5	0.1%
<i>Acacia sophorae</i>	Coast Wattle	0	0.0%
<i>Acacia</i> sp.	Unspecified wattle	5	0.1%
<i>Acer japonicum</i>	Japanese Maple	2	0.0%
<i>Acer negundo</i>	Box Elder	5	0.1%
<i>Acer platanoides</i> cultivar	Norway Maple cultivar	1	0.0%
<i>Aesculus X carnea</i>	Red Horse Chestnut	1	0.0%

<i>Virgilia oroboides</i>	Cape Lilac	1	0.0%
<i>Vitis vinifera</i>	Grape vine	400	8.0%
<i>Zelkova serrata</i>	Japanese Zelkova	3	0.1%
Grand Total		5021	100.0%

7.b. Life expectancy

An estimate of the life expectancy for each tree was made based on the tree's current health, condition, and growing environment. Any significant change in these factors in the future will affect the life expectancy of the tree.

A summary of the life expectancy of the trees on the site is provided in the following table.

Table 3

Life expectancy	No of trees	% of total
50 plus years	2602	51.8%
30 - 50 years	1462	29.1%
10 - 30 years	645	12.8%
Less than 10 years	227	4.5%
Dead	85	1.7%
Grand Total	5021	100.0%

7.c. Life stage

The life stage of each tree was assessed and is expressed as described in the following descriptions. Life stage is based on species characteristics and the rate at which the individual tree is growing in its local environment. As such, Life Stage can be quite independent of the chronological age of the tree.

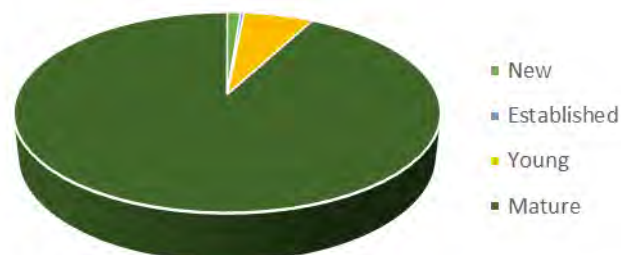

Table 4

Life stage	Description
New	<ul style="list-style-type: none"> Planting hardware present and under maintenance (watered) Self-seeded sapling
Established	<ul style="list-style-type: none"> Planting hardware absent/unmaintained Not being watered Susceptible to casual vandalism
Young	<ul style="list-style-type: none"> Established Rapid vertical growth phase Too big to be damaged by casual vandalism
Mature	<ul style="list-style-type: none"> Vertical growth slowed Canopy spreading or stable
Aged	<ul style="list-style-type: none"> Older specimen Self-retrenchment may have started Likely to have habitat hollows Large dead or broken branches may be present in upper canopy
Veteran	<ul style="list-style-type: none"> Very old specimen for the species in the local area Usually has started to shed limbs with age, develop hollows High value habitat Generally, requires target management in well used areas Not suitable for short-lived species e.g. most <i>Acacia</i> spp., <i>Hakea</i> spp.
Senescent	<ul style="list-style-type: none"> Old tree in terminal decline Majority of canopy is dead wood A stag with limited canopy

A summary of the life stage of the trees on the site is provided in the following table.

Table 5

Life stage	No of trees	% of total
New	60	1.2%
Established	16	0.3%
Young	315	6.3%
Mature	4630	92.2%
Grand Total	5021	100.0%

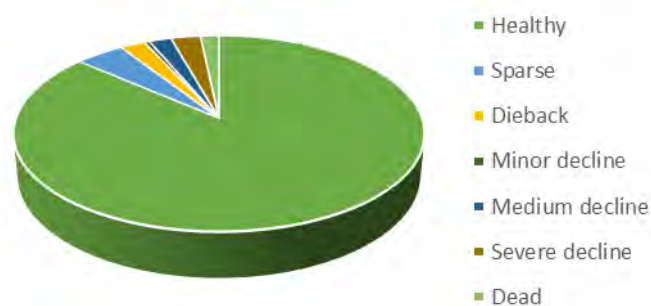

7.d. Health / Canopy condition

The health of the tree was assessed based on visual factors including foliage colour, canopy density, shoot extension growth, the presence of deadwood and dieback.

A summary of the health of the trees on the site is provided in the following table.

Table 6

Health	No of trees	% of total
Healthy	4335	86.3%
Sparse	226	4.5%
Dieback	114	2.3%
Minor decline	25	0.5%
Medium decline	101	2.0%
Severe decline	135	2.7%
Dead	85	1.7%
Grand Total	5021	100.0%

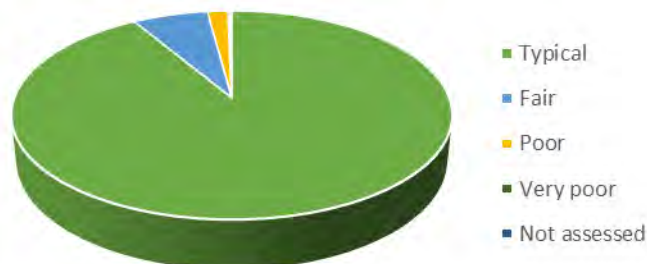

7.e. Structure

An overall assessment of the mechanical structure of the tree was made based on observable factors including tree form, branch attachment and taper, wood decay and cavities, previous pruning, and any damage the tree has suffered. A tree with factors that fall within the expected range for the species and size, and that do not significantly increase the risk posed by the tree, will be rated as Typical.

A summary of the structure of the trees on the site is provided in the following table.

Table 7

Structure	No of trees	% of total
Typical	4592	91.5%
Fair	324	6.5%
Poor	88	1.8%
Very poor	9	0.2%
Not assessed	8	0.2%
Grand Total	5021	100.0%

7.f. Origin

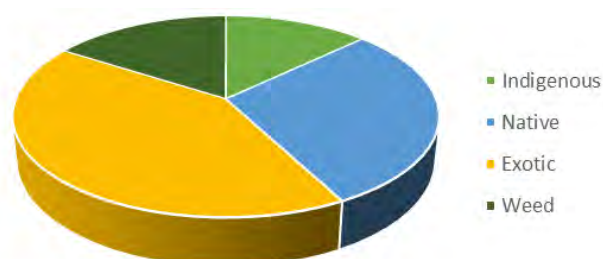

The likely origin of the tree has been evaluated based on species, location and context.

Retention Rating	Description
Indigenous	Locally indigenous species that is self-seeded from nearby remnant vegetation or revegetated areas.
Native planted	Australian native species that has been purposefully planted. This may include planted examples of locally indigenous species.
Exotic	Species from outside Australia. This may include weed species.
Weed	Environmental or declared weed species

A summary of the likely origin of the trees is provided in the following table.

Table 8

Origin	No of trees	% of total
Indigenous	650	12.9%
Native	1471	29.3%
Exotic	2099	41.8%
Weed	801	16.0%
Grand Total	5021	100.0%

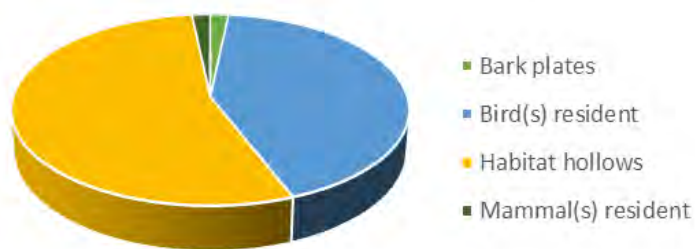

7.g. Ecological features

Notable ecological tree features were noted when observed. This is not a comprehensive ecological study.

Table 9

Ecology	No of trees	% of total
Bark plates	1	1.7%
Bird(s) resident	25	42.4%
Habitat hollows	32	54.2%
Mammal(s) resident	1	1.7%
Grand Total	59	100.0%

7.h. Retention value

Each tree has been given a retention rating. The ratings and general descriptions are provided in the following table. When applying a Retention rating within the same species some relativity is applied taking into account size and condition to assist in prioritising preservation. Individual Retention ratings for each tree or group are provided in the accompanying data tables.

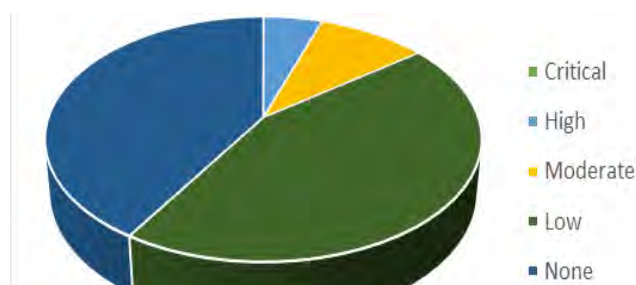

Table 10

Retention Rating	Description
Critical	Protected/significant/specimen tree/patch in good condition
High	Mature/rare/indigenous/habitat/landscape specimen tree/patch in good condition
Moderate	Mid-sized tree, other landscape specimens
Low	Small / miscellaneous planted trees in good condition
None	Small, dead, poor condition or weed species

A summary of the Retention rating for individual trees is provided in the following table. Many of the trees occur in rows or groups where the overall Retention rating of the group may be higher or lower than the individuals within the group.

Table 11

Retention	No of trees	% of total
Critical	2	0.0%
High	258	5.1%
Moderate	479	9.5%
Low	2217	44.2%
None	2065	41.1%
Grand Total	5021	100.0%

The Retention values are shown on maps in Appendix 1 & 2.

7.i. Summary by address

A summary of tree occurrence is provided in the following table. Access to some properties could not be arranged (see map in section 14.a). In these cases, as far as practical, the number and type of trees was assessed remotely from adjoining land. While some properties could not be accessed it is expected that the majority of trees have been accounted for in the assessment.

8. DISCUSSION

8.a. AS4970-2009 *Protection of trees on development sites*

Where access was available to measure individual trees, the Tree Protection Zone and Structural Root Zone for each of the trees has been calculated in accordance with AS4970-2009 *Protection of trees on development sites*. The radius of the nominal zones in metres is provided in the tree data.

Australian Standard 4970 provides formulae for the calculation of Tree Protection and Structural Root Zones. These are the critical spaces required to prevent catastrophic damage leading to immediate failure, and to provide adequate soil volume for the long-term viability of existing trees. Effective protection of the TPZ is required if retained trees are to be effectively preserved.

Robust fencing or barriers must be in place to protect the TPZ of preserved trees for the duration of any works in their vicinity. The TPZ must not be used for any activity during any works, including but not limited to –

- Vehicle and machinery access or parking
- Materials handling or storage
- Dumping or storage of spoil

Encroachment of the TPZ can often be achieved with due care, planning and appropriate construction techniques. A Project Arborist is required in these cases to determine appropriate methods and controls to ensure the health and integrity of the tree.

The Project Arborist must be a consulting arborist that holds a Diploma in Arboriculture (AQF Level 5) and has extensive experience in building and development projects.

8.b. The value of the trees to the landscape

There are few trees remaining in this landscape that is currently used for agriculture and horticulture. Trees deliberately planted as shelterbelts, screening or for ornamental purposes are dominant.

No substantial patches of native vegetation remain although scattered remnant or regenerated indigenous specimens are present (Photo 1).

Tree canopy is dominated by small mature trees that typically only have local landscape value. Where they are healthy and established, large trees should be targeted for preservation as they will provide immediate enhancement to the landscape.

8.c. Key biodiversity issues and implications

Lacking substantive native vegetation patches limits the biodiversity value of the trees in the project area. That said, there are a small number of trees with active or structural habitat value, such as habitat hollows that should be preserved in public open space.

Enhancing biodiversity values and linkages is a key opportunity for the redevelopment of the project area, especially given the proximity of the Royal Botanic Gardens Cranbourne.

8.d. Implications of urban development on the health and structural condition of trees

Development of the Casey Fields South and Devon Meadows PSP is expected to focus on industrial use. Typically, tree canopy cover in industrial areas is extremely low and experience suggests landowners and users in these areas typically do not value tree canopy cover.

Figure 4 shows an example of recent industrial development in Dandenong South. While outside the City of Casey, it provides an illustration of the low likelihood of any substantive tree canopy cover on the private land.

Photo 1

If development of the PSP proceeds along the typical model for such areas it is expected that most of the existing trees will be lost to the community.

Adequate public land and wide road reserves will be essential if community expectations for tree canopy cover are to be met in this area, or to achieve any biodiversity value within the precinct.

The opportunity to create building setbacks and require green areas and tree canopy within the private land should be explored to improve the function, amenity and appeal of the area as a desirable place to work.

For any trees retained it will be essential to design the sites and provide adequate space to ensure their Structural Root Zones and 90% of their Tree Protection Zones are adequately protected as stipulated by AS4970-2009 *Protection of trees on development sites*.

Figure 4 – Dandenong South industrial development

A significant decrease in water permeability is typical with development. Reduction of available soil water can be a critical factor in detrimentally affecting the health of preserved trees. Designing the landscape to ensure adequate water permeability including soil levels, drainage and surface permeability, is a major component of ensuring effective tree preservation and achieving tree canopy covers goals will be achieved.

9. REMEDIAL WORK

Remedial maintenance recommendations have been provided for specific trees based on their retention and incorporation into development. These works are not necessary while the trees are part of the existing rural landscape. Please see the accompanying data tables for work recommendations.

9.a. Pruning

Any pruning work must be carried out by appropriately qualified arborists working to AS4373-2007 *Pruning of amenity trees*, Minimum Industry Standard *MIS308 Tree pruning* and Minimum Industry Standard *MIS312 Environmental arboriculture*.

10. CONCLUSION

812 individual trees and 217 groups were assessed, for a total of 5021 trees. While some properties could not be accessed, remote assessment from adjoining land has provided a good representation of the trees present.

Industrial development of the area is expected and if it proceeds as is typical for such development, it is expected that most of the current trees will be lost.

11. RECOMMENDATIONS

The key recommendations for the existing trees and providing good future function and amenity for the Casey Fields South and Devon Meadows PSP are provided below.

- Preserve and protect the 2 Critical Retention value and 258 High Retention value trees.
- Where practical preserve other existing trees that are in good condition.
- For any trees retained design the sites such that adequate space to ensure their Tree Protection Zones are adequately protected as stipulated by AS4970-2009 *Protection of trees on development sites*.
- Show trees to be retained and their Tree Protection Zones on all planning and design documentation to ensure adequate planning for their preservation and protection.
- Require strict adherence to AS4970 for trees to be retained and ensure this is requirement included in all documentation.
- Provide public land and wide road reserves with sufficient unpaved areas to accommodate sufficient number and size of **mature trees to meet Council's tree canopy cover and biodiversity goals**.
- Design drainage and water flow to enhance the growing environment for trees by ensuring adequate water permeability in the landscape.
- Require building setbacks, green areas and minimum tree canopy cover goals within private land to improve the function, amenity and appeal of the area as a desirable place to work.
- Enhance biodiversity values and linkages with the Royal Botanic Gardens Cranbourne by creating contiguous corridors of locally indigenous flora.

12. DISCLOSURE STATEMENT

ENSPEC Pty Ltd and their employees are specialists who use their knowledge, training and education (qualifications), infield learning experiences, personal experiences research, diagnostic tools, scientific equipment to examine trees, recommend measures to enhance the beauty, health and preservation of trees, to reduce the risk of living near trees.

Trees are living organisms that can be affected by pests, diseases, and natural events outside of ENSPEC control. ENSPEC and their employees cannot detect every condition that affects a trees health, condition, and structural integrity. Conditions are often **hidden within trees and below ground where humans cannot naturally see. Unless otherwise stated, ENSPEC's employee's observations have been visually made from ground level.**

In the event that ENSPEC recommends retesting or inspection of trees at stated intervals, or ENSPEC recommends the installation engineering solutions, ENSPEC must inspect the engineering solution at intervals of not greater than 12 months, unless otherwise **specified in writing. It is the client's responsibility to make arrangements with ENSPEC to conduct re-inspections.**

Intervention treatments of trees may involve considerations beyond the scope of ENSPEC's service, such as property boundaries and ownership, disputes between neighbours, sight lines, landlord-tenant matters, and other related incidents. ENSPEC cannot take such issues into account unless complete and accurate information is given prior or at the time of the site inspection. Likewise, ENSPEC Pty Ltd cannot accept responsibility for the authorisation or non-authorisation of any recommended treatment or remedial measures undertaken.

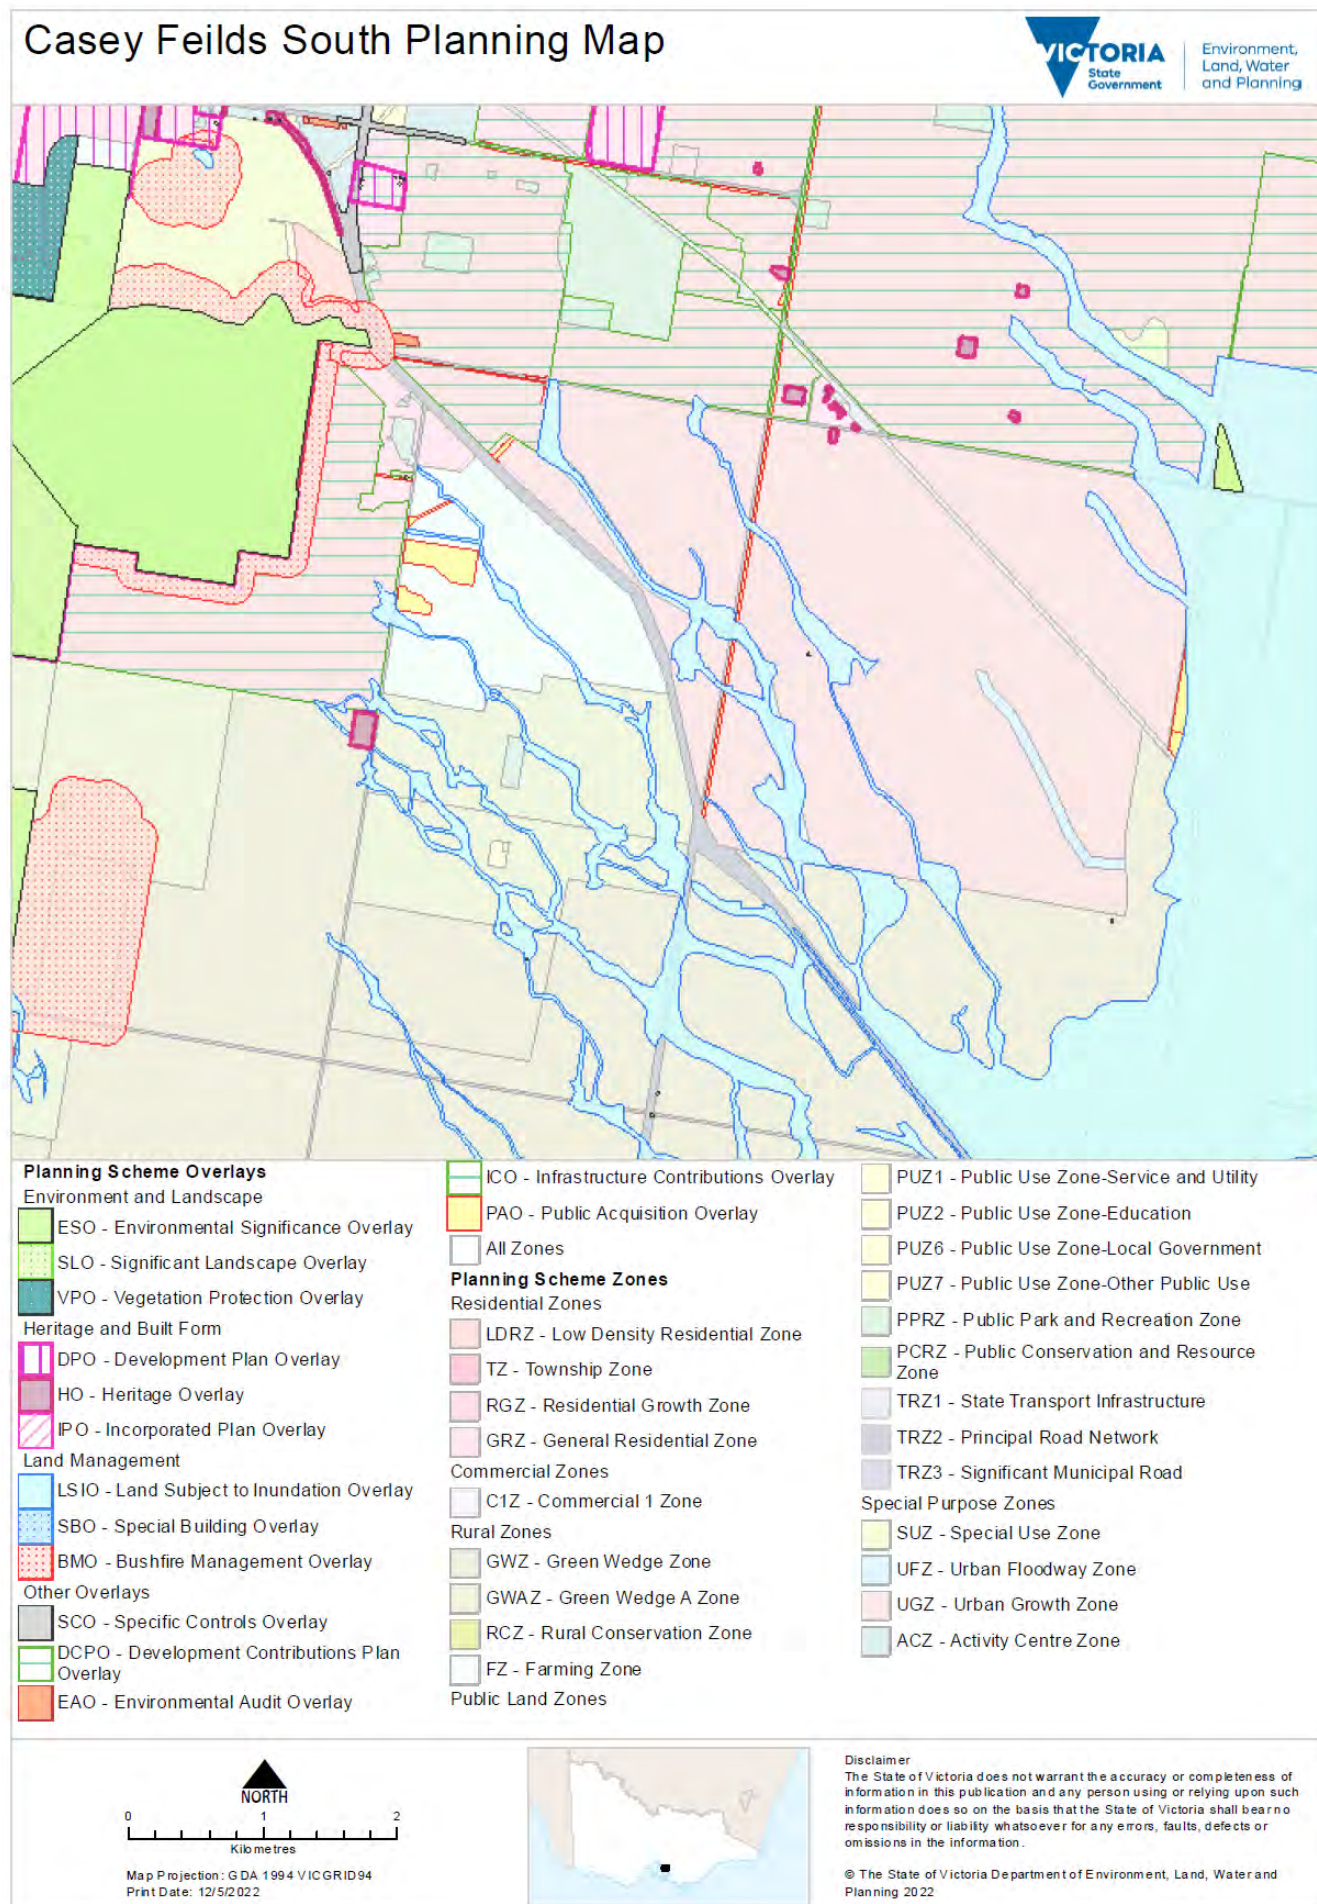

ENSPEC Pty Ltd cannot guarantee that a tree will be healthy or safe under all circumstances or for a specified period of time after our initial inspection and recommendations.

If this written report is to be used in a court of law, or any other legal situation, or by other parties ENSPEC must be advised in writing prior to the written report being presented in any form to any other party. All written reports must be read in their entirety. At no time shall part of the written assessment be referred to unless taken in full context with the whole written report.

Clients may choose to accept or disregard the recommendations of the assessment and written report.

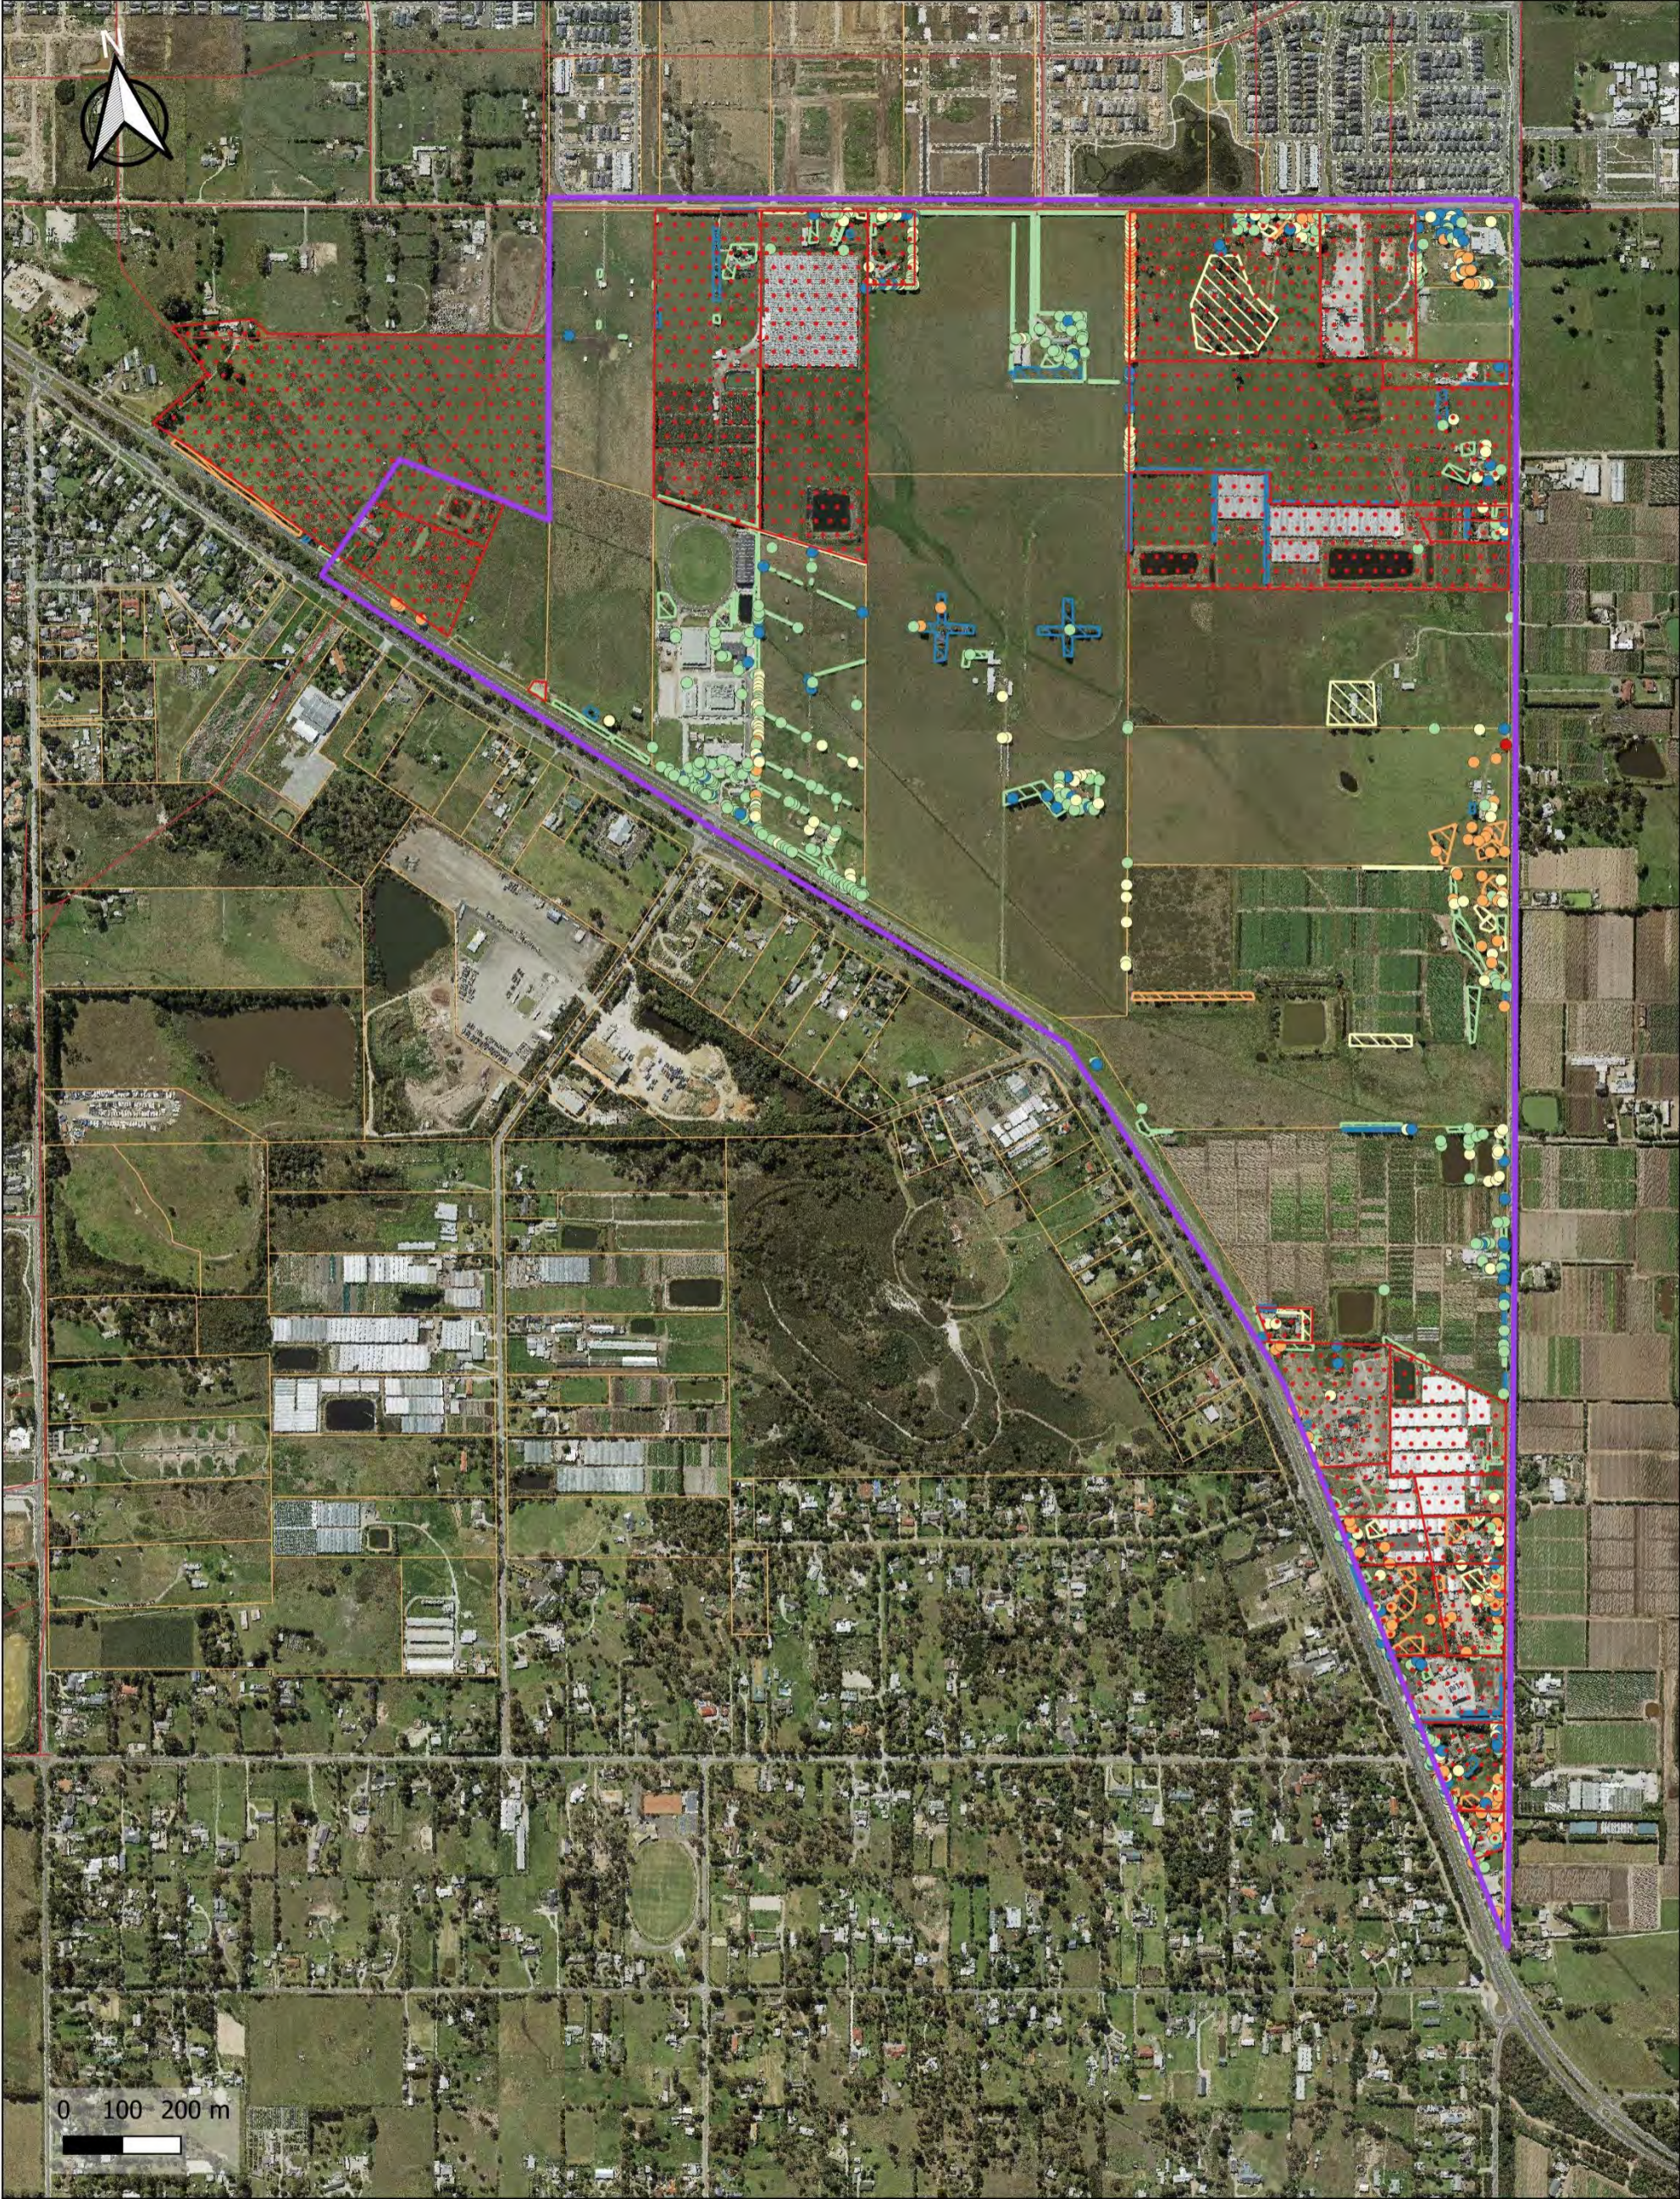

Notwithstanding anything in the report, express or implied, the client is not entitled to recover from ENSPEC Pty Ltd, its employees, agents and/or subcontractors any damages for business interruption or loss of actual or anticipated revenue, income or profits or any consequential, special, contingent or penal damage, whatsoever, and the client releases ENSPEC Pty Ltd from any such liability. Without limitation of the foregoing, a party shall at all times be limited (to the extent permitted by law) damages in the amount paid by the Client to ENSPEC Pty Ltd for ENSPEC Pty Ltd services. The limitation applies whether the claim is based on warranty, contract, statute, tort (including negligence) or otherwise.
